ENR 1.4 Air Traffic Services (ATS) Airspace Classification and Description

1.4.1 ATS Airspace Classification

For information on the airspace structure in Canada, refer to “Part VI – General Operating and Flight Rules” of the Canadian Aviation Regulations (CARs), Section 601.01, “Division I – Airspace Structure, Classification and Use” available at:

<https://lois-laws.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-601.01>

1.4.2 ATS Airspace Description

For more detail on the description of Canadian Domestic airspace, refer to the Designated Airspace Handbook (TP 1820E), available in PDF on the Aeronautical Information Products section of the NAV CANADA website:

<www.navcanada.ca>
Aeronautical Information
Operational Guides
Canadian Airport Charts and Designated Airspace Handbook
Designated Airspace Handbook
Download current issue

To download a chart depicting Canada’s airspace classification, refer to Transport Canada’s publication Canada’s Airspace: Information on Airspace Classification and Structure (TP 6010), available at:

<https://www.tc.gc.ca/Publications/BIL/TP6010/PDF/HR/TP6010B.PDF>

ENR 1.5 Holding, Approach and Departure Procedures

1.5.1 General

For general information on holding, approach and departure procedures, refer to the Canada Air Pilot, General (CAP GEN).

The instrument procedures published in the Canada Air Pilot (CAP), Volumes 1–7, and Restricted Canada Air Pilot (RCAP) are considered to be public procedures. However, the instrument procedures contained in the RCAP do not meet Transport Canada Civil Aviation design criteria. Accordingly, the use of RCAP procedures is restricted to pilots-in-command operating aircraft under an air operator certificate or a private operator certificate, including the appropriate RCAP special authorization. Authorization is required from Transport Canada Civil Aviation prior to the use of any Restricted Canada Air Pilot procedure.

These publications are available for purchase from NAV CANADA’s e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store
1.5.2 Arriving Flights

For information on the procedures for arriving flights, refer to the *Transport Canada Aeronautical Information Manual* (TC AIM) (TP14371E) Section RAC 9.0, "Instrument Flight Rules (IFR) — Arrival Procedures." This publication can be found on the Transport Canada website at:

For arrival procedures for VFR Traffic by aerodrome, refer to the PRO section in the *Canada Flight Supplement* (CFS), Section B, “Aerodrome/Facility Directory” or *Canada Water Aerodrome Supplement* (CWAS) Section B, “Aerodrome/Facility Directory.”

Specific STAR procedures are depicted by aerodrome in the respective *Canada Air Pilot* (CAP).

These publications are available for purchase from NAV CANADA's e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store

1.5.3 Departing Flights

For information on the procedures for departing flights, refer to the *Transport Canada Aeronautical Information Manual* (TC AIM) (TP14371E) Section RAC 7.0, "Instrument Flight Rules – Departure Procedures." This publication can be found on the Transport Canada website at:

Specific SID procedures are depicted by aerodrome in the respective *Canada Air Pilot* (CAP).

These publications are available for purchase from NAV CANADA's e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store

1.5.4 Other Relevant Information and Procedures

Nil

ENR 1.6 ATS Surveillance Services and Procedures

1.6.1 Primary Radar

Canada provides ATS surveillance services using surveillance data processing systems that fuse inputs from various surveillance sources and apply a weighting to each input to produce the best possible position. Because primary surveillance radar (PSR) weighting is low, PSR in Canada is not generally relied on for the provision of ATS surveillance services.
1. At select airports, PSR inputs may be included in surveillance data processing systems to support certain operations such as the use of PSR/PAR at military airports. For a list of PSR/PAR approach civil minima see the following publication:
   - Canada Air Pilot, General Pages

3. For information on ATS surveillance and radio failure procedures, refer to the following publications:
   - Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot
   - Canada Flight Supplement, Section F, “Emergency” or Canada Water Aerodrome Supplement, Section E, “Emergency”

4. For information on voice position reporting requirements, refer to the CFS, Section B “Aerodrome/Facility Directory” under procedures for each aerodrome, CFS, Section C, “Planning” and CFS, Section E, “Military Flight Data and Procedures.” To determine the location of compulsory and on-request reporting points in Canadian domestic airspace, refer to the VFR navigation charts (VNC), VFR terminal area charts (VTA) and Enroute Charts (LO and HI).

   These publications are available for purchase from NAV CANADA’s e-commerce store at:
   <www.navcanada.ca>
   Aeronautical Information
   Online Store

5. For a map of radar coverage in Canada, see Figure 1.6.2, “Secondary Surveillance Radar Coverage”.

1.6.2 Secondary Surveillance Radar (SSR)

2. For information on radio communications failure, unlawful interference procedures, and other emergency procedures, refer to the following publications:
   - Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot under SID procedures
   - Canada Flight Supplement, Section F, “Emergency” or Canada Water Aerodrome Supplement, Section E, “Emergency”
3. For SSR code assignments specific to an aerodrome or terminal airspace, refer to the Canada Flight Supplement or the Canada Water Aerodrome Supplement, Section B, “Aerodrome/Facility Directory,” the PRO section. For general SSR code assignments refer to the Canada Flight Supplement or Canada Water Aerodrome Supplement, Section C “Planning” under the paragraph entitled “Use of Transponder Codes.” These publications are available for purchase from NAV CANADA’s e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store

4. For information on CPDLC position reporting requirements, refer to GEN 3.4.4, “Requirements and Conditions” in the AIP under subsection 3.4.4.2, “Data Link Services.”

5. For a map of SSR coverage in Canada, see Figure 1.6.2, “Secondary Surveillance Radar Coverage.”

![Figure 1.6.2, Secondary Surveillance Radar Coverage.](image-url)
1.6.3 Automatic Dependent Surveillance–Broadcast (ADS-B)

All aircraft that emit position information using a 1090 MHz extended squitter (1090ES) may be provided surveillance separation services, provided they meet the airworthiness compliance requirements defined in:

1. European Aviation Safety Agency (EASA) AMC 20-24; or
2. European Aviation Safety Agency (EASA) CS ACNS; or
3. Federal Aviation Administration (FAA) Title 14 Code of Federal Regulations (14 CFR) section 91.227 or AC No. 20-165A (or replacement) – Airworthiness Approval of ADS-B; or

ADS-B Out systems that are unable to meet the above requirements must disable ADS-B transmission unless:

1. the aircraft always transmits a value of 0 (zero) for one or more of the position quality indicators (NUCp, NIC, NAC or SIL); or
2. the operator has received an exemption from NAV CANADA.

For information on radio communications failure, unlawful interference procedures, and other emergency procedures, refer to the following publications:

- Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot
- Canada Flight Supplement, Section F, “Emergency” or Canada Water Aerodrome Supplement, Section E, “Emergency”

A Flight ID that is an exact replica of the Aircraft Identification entered in field 7 of the ICAO Flight Plan must be programmed into the transponder or flight management system (FMS) in order to receive surveillance services. Airline aircraft will use the three-letter ICAO airline code, not the two-letter IATA code. In addition, field 10 should indicate ADS-B capability on the ICAO Flight Plan.

Surveillance separation services based on space-based ADS-B are available throughout Canadian Domestic Airspace (CDA) from FL 290 and above.

1.6.3.1 ADS-B Services in the Edmonton FIR

ADS-B service has expanded into oceanic and remote areas facilitated by a constellation of low earth orbit (LEO) satellites hosting ADS-B receivers. Satellites receive ADS-B data, which is then routed through other satellites and down-linked to a satellite operations ground station. The expanded surveillance system will permit uninterrupted ATS surveillance for equipped aircraft operating in Northern Canadian Airspace in the Edmonton FIR.

As a result of the expanded surveillance coverage, surveillance separation standards are available for eligible aircraft using both VHF and CPDLC.
In areas where VHF voice communication is not available, surveillance separations are applied using CPDLC. To be eligible, aircraft must meet the following requirements:

- ADS-B equipped, with dedicated 1090 MHz out capability with extended squitter (ES)
- Specifications for RNP 4
- Specifications of RCP 240

ATS systems use Field 10 (Equipment) of the standard ICAO flight plan to identify an aircraft’s data link and navigation capabilities. Operators should insert the following items into the ICAO flight plan (as per the 2012 flight plan format) for FANS 1/A or equivalent aircraft:

- Field 10a (Radio communication, navigation and approach aid equipment and capabilities);
  - insert “J5” to indicate CPDLC FANS1/A SATCOM (Inmarsat) or “J7” to indicate CPDLC FANS1/A SATCOM (Iridium) data link equipment. To be eligible for the space-based ADS-B with CPDLC separations, flights must maintain an active J5/J7 connection. Edmonton ACC will monitor all active datalink connections to ensure compliance; and
  - insert “P2” to indicate RCP 240 approval.
Field 10b (Surveillance equipment and capabilities):
- insert “D1” to indicate ADS with FANS1/A capabilities; and
- B1 or B2 to indicate ADS-B.
Field 18 (Other Information): insert the characters “PBN/L1” for RNP4.

Figure 1.6.3.1-2, ATS Surveillance Without VHF Coverage (CPDLC)

Flight crews are expected to comply with normal non-surveillance procedures, which include position reports via voice or ADS-C, and all other operator-specific procedures currently used.

**Service Limitations North of 72° North**

In Edmonton FIR, Inmarsat satellite coverage has limitations in the north; flights operating only with Inmarsat equipment may experience unreliability north of 72° North (N). Also, there is no Inmarsat satellite coverage north of 80° N, so flights will be unable to use satellite voice communications (SATVOICE) services in this area using Inmarsat. Iridium SATVOICE services are available north of 80° N. Operators of aircraft that are equipped with both Inmarsat and Iridium modems should ensure that they switch to the Iridium system before operating north of 72° N.

Based on these service area limitations, operators are advised that Iridium-equipped flights (J7 in the ICAO flight plan) will be eligible for the space-based ADS-B with CPDLC separations in the entirety of the Edmonton FIR. For flights that are Inmarsat only (J5 in the ICAO flight plan), the separation would be available only within Inmarsat coverage.
In addition to expanded surveillance coverage and reduced separations, Aireon ALERT Aircraft Locating Emergency Response Tracking is now in operation. ALERT is a free global aircraft tracking solution that captures ADS-B data available to be shared with appropriate registered SAR organizations, ANSPs, Aircraft Operators, and Regulators.

To register for Aireon ALERT, ANSPs, Aircraft Operators, Regulators and Search and Rescue refer to <www.aireonalert.com>.

1.6.4 Other relevant information and procedures

1.6.4.1 Multilateration

Multilateration (MLAT) services have been implemented at four international airports: CYYZ, CYYC, CYUL and CYVR. This surveillance is used in Canada to enhance surface movement and ground control.

ENR 1.7 Altimeter-setting Procedures

The altimeter setting procedures in use are based on Criteria for the Development of Instrument Procedures (TP 308E), a document developed and produced by Transport Canada, Aerodromes and Air Navigation Branch.

For information on basic altimeter-setting procedures and for altimeter-setting procedures applicable to operators (including pilots) within Canada, refer to the sections on Transport Canada’s CARs website that are listed in Table 1.7, “Altimeter-setting Procedures.”

<table>
<thead>
<tr>

</tbody>
</table>

The altimeter setting region is an airspace of defined dimensions below 18 000 feet above sea level (ASL). For a map of the altimeter-setting region, refer to the following publications:

- Canada Flight Supplement or Canada Water Aerodrome Supplement, Section C, “Planning – Altimeter Setting and Designated Mountainous Regions”

For a table of cruising levels, refer to the following publications:

- Canada Flight Supplement or Canada Water Aerodrome Supplement, Section C, “Planning – Characteristics of Airspace – Cruising Altitudes and Flight Levels Appropriate to Aircraft Track”
Cold dry air masses can produce barometric pressures in excess of 31.00 inches of mercury. Because barometric readings of 31.00 inches of mercury or higher rarely occur, most standard altimeters do not permit the setting of barometric pressures above that level and are not calibrated to indicate accurate aircraft altitude above 31.00 inches of mercury. As a result, most altimeters cannot be set to provide accurate altitude readouts to the pilot in these situations.

ATC will issue actual altimeter settings and will confirm with the pilot that 31.00 inches of mercury is set on the pilot’s altimeters for enroute operations below 18 000 feet ASL in the affected areas.

Aerodromes that are unable to accurately measure barometric pressures above 31.00 inches of mercury will report the barometric pressure as “in excess of 31.00 inches of mercury”. Flight operations to and from those aerodromes are restricted to VFR weather conditions.

When the barometric pressure exceeds 31.00 inches of mercury, the following procedures take effect:

Altimeters of all IFR, controlled VFR flight (CVFR) and VFR aircraft are to be set to 31.00 inches of mercury for enroute operations below 18 000 feet ASL. All pilots are to maintain this setting until beyond the area affected by the extreme high pressure or until reaching the final approach segment of an instrument approach for IFR aircraft or the final approach for VFR aircraft. At the beginning of the final approach segment, the current altimeter setting will be set by those aircraft capable of such a setting. Aircraft that are unable to set altimeter settings above 31.00 inches of mercury will retain a 31.00 inches of mercury setting throughout the entire approach. Aircraft on departure or missed approach will set 31.00 inches of mercury prior to reaching any mandatory or fix crossing altitude, or 1 500 feet above ground level (AGL), whichever is lower.

For aircraft operating IFR that are unable to set the current altimeter setting, the following restrictions apply:

To determine the suitability of departure alternate aerodromes, destination aerodromes and destination alternate aerodromes, increase the ceiling requirements by 100 feet and visibility requirements by 1/4 statute mile (SM) for each 1/10 inch of mercury, or any portion thereof, over 31.00 inches of mercury. These adjusted values are then applied in accordance with the requirements of the applicable operating regulations and operations specifications.

Example: Destination altimeter setting is 31.28 inches, instrument landing system (ILS) decision height (DH) is 250 feet (200-1/2). When flight planning, add 300-3/4 to the weather requirements, which would now become 500-1 1/4.

During the instrument approach, 31.00 inches of mercury will remain set. DH or Minimum Descent Altitude (MDA) will be deemed to have been reached when the published altitude is displayed on the altimeter.

Note: Although visibility is normally the limiting factor on an approach, pilots should be aware that when reaching DH, the aircraft will be higher than indicated by the altimeter, which in some cases could be as much as 300 feet higher.

Authorized CAT II and III ILS operations are not affected by the above restrictions.

Night VFR pilots are advised that under conditions of altimeter settings above 31.00 inches of mercury and aircraft altimeters not capable of setting above 31.00 inches of mercury, the aircraft’s true altitude will be higher than the indicated altitude; this must be taken into consideration. If an instrument approach procedure is to be flown, the night VFR pilot should follow the procedures described above for aircraft operating IFR.

For aircraft with the capability of setting the current altimeter setting and operating into aerodromes with the capability of measuring the current altimeter setting, no additional restrictions apply.

For aircraft operating VFR, no additional restrictions apply; however, extra diligence in flight planning and in operating in these conditions is essential.
ENR 1.8 Regional Supplementary Procedures

For information on regional supplementary procedures affecting the entire area of responsibility, refer to the following publications:

- *Canada Air Pilot*, General (CAP GEN)
- *Canada Air Pilot* (CAP) Volumes 1–7
- *Restricted Canada Air Pilot* (RCAP)
- *Canada Water Aerodrome Supplement* (CWAS), Section B, “Aerodrome/Facility Directory”

**Note:** In the *Canada Flight Supplement* (CFS) and the *Canada Water Aerodrome Supplement* (CWAS), the table for an aerodrome may have a VFR Terminal Procedures Chart or a subheading PRO, or both, and these may contain information on the procedures affecting the entire area of responsibility.

These publications are available for purchase from NAV CANADA’s e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store

ENR 1.9 Air Traffic Flow Management

Air traffic flow management (ATFM) programs have been developed to ensure that national ATC systems are used to maximum capacity and that the need for excessive enroute airborne holding, especially at low altitude, is minimized. ATFM also distributes required delays more equitably among users.

ATFM initiatives in Canada include:

- the publication in the *Canada Air Pilot* and the *Restricted Canada Air Pilot* of standard instrument departure (SID) and standard terminal arrival (STAR) procedures;
- the rerouting of aircraft because of sector overloading and weather avoidance;
- flow-control metering of arriving aircraft into terminal control areas (TCAs); and
- the implementation of flow-control restrictions whereby aircraft are more economically held on the ground at departure airports to partially absorb calculated arrival delays at a destination airport.

In the *Canada Flight Supplement* and the *Canada Water Aerodrome Supplement*, Section B, “Aerodrome/Facility Directory,” the table for an aerodrome may have a subheading RESTRICTIONS that contains information affecting the flow of traffic at the aerodrome.

Additional information can be obtained by contacting NAV CANADA, National Operations Centre, at 1 866-651-9053 (Canada) or 1 866-651-9056 (US), or the shift manager or ATFM unit of the applicable area control center (ACC) through the telephone numbers provided in Table 1.9, “ACC Contact Numbers.”
### 1.9.1 Flow Control Procedures

To minimize delays, air traffic management will use the least restrictive methods:

- Altitude
- Miles-in-trail/Minutes-in-trail
- Speed control
- Fix balancing
- Airborne holding
- Sequencing programs

**Departure sequencing program** assigns a departure time to achieve a constant flow of traffic over a common point. Runway and departure procedures are considered for accurate projections.

**Enroute sequencing program** assigns a departure time that will facilitate integration into an enroute stream. Runway configuration and departure procedures will be considered for accurate projections.

**Arrival sequencing program** assigns meter fix times to aircraft destined to the same airport.

**Ground delay program** is an air traffic management process administered by the flow manager whereby aircraft are held on the ground. The purpose of the program is to support the air traffic management mission and limit airborne holding. It is a flexible program and may be implemented in various forms depending on the needs of the air traffic system. Ground delay programs provide for equitable assignment of delays to all system users.

**Ground stop** is a process whereby an immediate constraint can be placed on system demand. The constraint can be total or partial. The ground stop may be used when an area, centre, sector, or airport experiences a significant reduction in capacity. The reduced capacity may be the result of weather, runway closures, major component failures, or any other event that would render a facility unable to continue providing ATS.

This list is not inclusive and does not preclude the innovation and application of other procedures that result in improved customer service.
ENR 1.10 Flight Planning

The flight plan format used in Canada is in accordance with the ICAO Flight Plan 2012 format and Annex 2 of the Convention on International Civil Aviation, "Rules of the Air", Chapter 3.

The rules associated with filing a flight plan in Canada are found in the Canadian Aviation Regulations (CARs) Part VI, “General Operating and Flight Rules,” Subpart 2, “Operating and Flight Rules,” Division III “Flight Preparation, Flight Plans and Flight Itineraries” as listed in Table 1.10, “Flight Planning.”

For more information on flight planning procedures, refer to the Transport Canada Aeronautical Information Manual (TC AIM) (TP14371E) Section RAC 3.0, “Flight Planning”. This publication can be found on the Transport Canada website at:

ENR 1.11 Addressing of Flight Plan Messages

Flight plans for aircraft flying under IFR in Canada are allocated according to flight information region (FIR) to the message addresses provided in GEN 3.4.4.2, “Data Link Services.”

Flight plans for aircraft flying under VFR are accepted and processed by flight information centres (FICs) in Canada. In the Canada Flight Supplement (CFS) and the Canada Water Aerodrome Supplement (CWAS), Section B, “Aerodrome/Facility Directory,” the table for each aerodrome has a subheading FLT PLN (Flight Planning) that may contain the appropriate FIC contact information under the entry FIC.

For more information about Canada’s FICs, refer to Airport Advisory and Flight Information Services on NAV CANADA’s website:

Air Traffic Services

ENR 1.12 Interception of Civil Aircraft

For information on interception procedures and visual signals, refer to the following publications:

- Canada Water Aerodrome Supplement, Section E, “Emergency – Interception of Civil Aircraft,” and “Interception Signals;” or
ENR 1.13 Unlawful Interference

For information on unlawful interference, refer to the following publications:

- Canada Flight Supplement, Section F, “Emergency – Interception of Civil Aircraft,” and “Unlawful Interference (HIJACK);”
- Canada Water Aerodrome Supplement, Section E, “Emergency – Interception of Civil Aircraft,” and “Unlawful Interference (HIJACK);” or
- Transport Canada Aeronautical Information Manual (TC AIM) (TP14371E) COM, Section 8.8, “Unlawful Interference.”

ENR 1.14 Air Traffic Incidents

The Aviation Operations Centre (AOC) is part of the Transport Canada Situation Centre, Emergency Management Branch. It is the focal point for providing services in the areas of operational response in support of the Civil Aviation emergency response mandate. In addition, the AOC participates in, or provides support to, the aviation-related activities of the North American Aerospace Defense Command (NORAD), the International Civil Aviation Organization (ICAO), the Federal Aviation Administration (FAA), and other foreign entities.

The AOC monitors the national civil air transportation system (NCATS) 24 hours a day, and responds to emergencies that require the attention or co-ordination of concerned functional branches of government, including regional offices and other government departments or agencies, as per contingency plans.

The AOC is the initial point of contact for all aviation-related occurrences. The AOC receives reports on accidents and any incidents that occur within the NCATS from various sources, including NAV CANADA, airport authorities, Public Safety Canada (PSC), law enforcement agencies, other government departments, foreign governments, and the general public. These reports are continuously monitored and then distributed to the appropriate functional areas of Transport Canada Civil Aviation for review, investigation (if necessary), and final inclusion in the Civil Aviation Daily Occurrence Reporting System (CADORS).

Reports requiring regional, modal, multi-modal, inter-departmental, or an outside agency's attention are immediately forwarded to that agency for further action.

An aircraft incident, as defined in the CADORS manual (TP 4044), is any occurrence involving an aircraft where:

1. An engine fails;
2. Smoke or fire occurs, other than an engine fire that is contained within the engine and does not result in engine failure or damage to other component parts of the aircraft;
3. Difficulties in controlling the aircraft in flight are encountered due to any aircraft system malfunction, weather phenomena, wake turbulence, operations outside the approved flight envelope or uncontrolled vibrations;
4. The aircraft fails to remain within the landing or takeoff area, lands with one or more landing gear retracted or drags a wing tip or engine pod;
5. Any crew member is unable to perform his or her flight duties as a result of incapacitation;

6. Decompression, explosive or otherwise, occurs that necessitates an emergency descent;

7. A fuel shortage occurs that necessitates a diversion or requires approach and landing priority at the destination of the aircraft;

8. The aircraft is refueled with the incorrect type of fuel or contaminated fuel;

9. A collision or risk of collision with any other aircraft or with any vehicle, terrain or obstacle occurs, including a collision or risk of collision that may be related to air traffic control procedures or equipment failures;

10. The aircraft receives a Traffic Alert and Collision Avoidance System (TCAS) Resolution Advisory;

11. A flight crew member declares an emergency or indicates any degree of emergency that requires priority handling by an air traffic control unit or the standing by of crash, firefighting or rescue services;

12. Toxic gases or corrosive materials leak from any area aboard the aircraft;

13. Unauthorized Incursion or operating irregularity involving vehicles, pedestrians or animals;

14. Failure of a navigational aid, approach aid, communications system, airport lighting, power failure or any other system breakdown which has an adverse effect upon flight safety or a major impact upon operations;

15. Criminal action – hijacking bomb threat, riot, sabotage, or a breach of aviation/airport security;

16. Unavailability of a runway due to snow, ice, flood, obstruction or foreign object that results in a major impact on airport operations;

17. Bird strikes, which result in aircraft damage or other operational impact;

18. Missing aircraft reports, Search and Rescue action (RCC launch and ELT activations);

19. Significant building and equipment fire or other major damage on airport property or TC remote sites;

20. Labour action affecting operational capability;

21. Item dropped from aircraft;

22. Regulatory infractions which have immediate safety implications, involve commercial carriers or may generate media attention;

23. Environment emergencies such as significant fuel spill, hazardous chemical or radioactive spill on airport property;

24. Accidental death or serious injury to employees or members of the public while on airport or TC property; or

25. Any occurrence which may generate a high degree of public interest or concern or could be of direct interest to specific foreign air authorities.

The Aviation Incident Report form is available on Transport Canada’s website at:

<https://www.tc.gc.ca/eng/civilaviation/opssvs/emergencies-incidentreporting-menu.htm>
A pilot should proceed as follows regarding an incident in which they have been involved:

1. During flight, use the appropriate air-ground frequency for reporting an incident of major significance, particularly if it involves other aircraft, so as to permit the facts to be ascertained immediately; and
2. As promptly as possible after landing submit an Aviation Incident Report.

Aviation Incident Reports are used to provide initial information on occurrences involving any Canadian-registered aircraft, as well as events that occur at Canadian airports, in Canadian sovereign airspace, or international airspace for which Canada has accepted responsibility that includes events involving foreign registered aircraft.

To report an aircraft accident or incident, individuals can contact the AOC 24 hours a day using one of the options in Table 1.14, “Contact List for the AOC.”

**1.14.1 ATS Reports**

Under current regulation, ATS units are required to report to the Minister of Transport any aviation occurrence that may contravene the CARs.

Any investigation of the circumstances or subsequent decision on whether a breach has taken place is the responsibility of Transport Canada. Any necessary follow-up action will be conducted by Transport Canada Civil Aviation regulatory authorities.

**1.14.2 Pilot Reports**

Pilots are requested to make the following reports in the interests of national security, meteorite research and forest fire and pollution control.

**1.14.2.1 CIRVIS Reports – Vital Intelligence Sightings**

Communication Instructions for Reporting Vital Intelligence Sightings (CIRVIS) reports should be made immediately upon a vital intelligence sighting of any airborne and ground objects or activities that appear to be hostile, suspicious, unidentified or engaged in possible illegal smuggling activity. Examples of events requiring CIRVIS reports are: unidentified flying objects, submarines, or surface warships identified as being non-Canadian or non-American; violent explosions; unexplained or unusual activity, including the presence of unidentified or suspicious ground parties in Polar regions, at abandoned airstrips or other remote, sparsely populated areas.

These reports should be made to the nearest Canadian or U.S. ATS unit.

A report via air/ground communications should include the words “CIRVIS CIRVIS CIRVIS”, followed by:

- the identification of the reporting aircraft;
• a brief description of the sighting (number, size, shape, etc.);
• the position of the sighted object or activity;
• the date and time of sighting in UTC;
• the altitude of the object;
• the direction of movement of the object;
• the speed of the object; and
• any identification.

1.14.2.2 Fire Detection – Northern Areas

Indigenous and Northern Affairs Canada (INAC) has requested the co-operation of all persons connected with aviation in the prevention, detection and suppression of fires in the northern areas of Canada.

Reports should be made to the nearest ATS Unit immediately upon sighting and include:

• location of the fire;
• approximate size of the fire;
• colour of the smoke; and
• direction of the smoke.

This information will assist fire crews in getting to fires with minimum delay and with the right type of equipment.

1.14.2.3 Pollution Reports

Any aircraft, upon sighting any vessel discharging pollutants (oil) in Canadian waters, Fishing Zones or Arctic Shipping Control Zones, should inform the nearest ATS unit.

The pollution report should include the following information:

• Name of air operator or aircraft owner
• Pilot’s name
• Destination of aircraft
• Aircraft’s identification
• Date and time of sighting
• Heading of vessel and name, port of registry and type (if possible)
• Latitude and longitude of sighting
• Type and extent of pollution
• Current and wind direction (if possible)
• Sea state (height of waves, if possible)

The ATS unit will forward any pollution reports to the Coast Guard Marine Communications and Traffic Services (MCTS) Centre. For more information refer to their website:

ENR 2. ATS AIRSPACE

ENR 2.1 FIR, UIR, TMA and CTA

2.1.1 Name, Limits, and Class of Airspace

The Canadian Domestic Airspace (CDA) is divided into 7 FIRSs: Vancouver, Edmonton, Winnipeg, Toronto, Montréal, Moncton and Gander. Gander Oceanic is an additional FIR allocated to Canada by ICAO over the high seas.

Canadian FIRs are described in the Designated Airspace Handbook (TP 1820E), this publication is available on the NAV CANADA website:

<www.navcanada.ca>
Aeronautical Information
Operational Guides
Canadian Airport Charts and Designated Airspace Handbook
Designated Airspace Handbook
Download current issue

To download a chart depicting Canada’s airspace classification refer to Transport Canada's publication Canada’s Airspace: Information on Airspace Classification and Structure (TP 6010), available at:

<https://www.tc.gc.ca/Publications/BIL/TP6010/PDF/HR/TP6010B.PDF>

Upper flight information regions (UIR) are not used in Canada.

2.1.2 Units Providing Service

There is an ACC providing air traffic services for each FIR, using the same name as the FIR (e.g. Vancouver ACC provides ATS for Vancouver FIR). The telephone numbers for the ACCs are provided in Table 3.4.4.1, "ATS Units, Short Codes and PSTN Number" in Section GEN 3.4.4, “Requirements and Conditions.”

2.1.3 Languages Used

English and French are the official languages used for radio communications in Canada. For a list of which language service is provided where, refer to GEN 3.4.3.5, “Language Services” or refer to the Canadian Aviation Regulations sections listed in Table 3.4.3.5, “Languages Used,” under section GEN 3.4.3.5

2.1.4 Frequencies and SATVOICE Numbers

For frequencies used by the ATS units within the FIRs, refer to the appropriate enroute chart. For SATVOICE numbers and datalink addresses refer to Table 3.4.4.1, “ATS Units. Short Codes and PSTN Numbers” in Section GEN 3.4.4, “Requirements and Conditions.”

2.1.5 Remarks

For information on control zones around military air bases, refer to the following publications:

- Canada Flight Supplement or
- Canada Water Aerodrome Supplement, Section B, “Aerodrome/Facility Directory” and
- Canada Flight Supplement, Section E, “Military Flight Data and Procedures”
These publications are available for purchase from NAV CANADA’s e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store

For information on emergency locator transmitter (ELT) requirements, refer to GEN 1.5.3, “Emergency Locator Transmitter.”

2.1.6 Control Zones Around Military Air Bases

For information on control zones around military air bases, refer to the following publications:

- Canada Flight Supplement
- Canada Water Aerodrome Supplement, Section B, “Aerodrome/Facility Directory,” and
- Canada Flight Supplement, Section E, “Military Flight Data and Procedures”

ENR 2.2 Other Regulated Airspace

2.2.1 Required Navigation Performance Capability Airspace

Required navigation performance capability (RNPC) airspace is defined as a controlled airspace within the Canadian Domestic Airspace (CDA) in the Designated Airspace Handbook (TP 1820E; see Figure 2.2.2, “RNPC, CMNPS and CMNPS Transition Airspace”). RNPC airspace accommodates area navigation (RNAV) operations and is contained within the Southern Domestic Airspace (SDA) and Northern Control Area (NCA).

The latest version of the Designated Airspace Handbook (TP 1820E) is available on the NAV CANADA website:

<www.navcanada.ca>
Aeronautical Information
Operational Guides
Canadian Airport Charts and Designated Airspace Handbook
Designated Airspace Handbook
Download current issue

Reduced air traffic control (ATC) separation criteria can be applied in RNPC airspace. To conduct RNAV operations (fixed or random routes) in the RNPC airspace, the required aircraft navigation equipment must be certified as capable of navigating within specified tolerances. Aircraft that have the required navigation equipment for operations in Canadian minimum navigation performance specifications (CMNPS) airspace and the North Atlantic High Level Airspace (NAT HLA) authorization (previously referred to as MNPS authorization) will satisfy all requirements for RNPC.

Separation in accordance with RNPC may be applied for flights within those portions of the Gander Oceanic and New York Oceanic flight information regions (FIRs) that are designated as being part of the Gander Domestic or Moncton Domestic control area (CTA).

RNAV operations require the following additional certifications:

- The aircraft must be certified by the State of Registry or the State of the Operator as meeting the RNPC permitted to conduct RNAV operations.
- Long-range RNAV systems must be certified and capable of navigation performance that permits position determination within ±4 NM. Such navigation performance capability must be verified by the State of Registry or the State of the Operator, as appropriate.
• One long-range RNAV system, plus a short-range navigation system (VHF omnidirectional range (VOR)/distance measuring equipment (DME), or automatic direction finder (ADF)), must be certified to meet the minimum navigation equipment requirement for RNPC operation.

2.2.2 Canadian Minimum Navigation Performance Specifications Airspace

CMNPS airspace is defined as a controlled airspace within CDA, between flight levels (FL) 330 and FL 410 in the Designated Airspace Handbook (TP 1820E) (see Figure 2.2.2, “RNPC, CMNPS and CMNPS Transition Airspace”). This airspace is contained for the most part in the Arctic Control Area (ACA) and the NCA, with a small portion in the Southern Control Area (SCA). The Designated Airspace Handbook (TP 1820E) is available on the NAV CANADA website:

<www.navcanada.ca>
Aeronautical Information
Operational Guides
Canadian Airport Charts and Designated Airspace Handbook
Designated Airspace Handbook
Download current issue

Reduced ATC separation criteria can be applied in the CMNPS airspace. To conduct RNAV operations in CMNPS airspace, aircraft must be certified as being capable of navigating within specified tolerances. A transition area underlying the lateral limits of CMNPS airspace exists from FL 270 to below FL 330 to permit both CMNPS-certified and non-certified aircraft to operate above FL 270.
Aircraft navigation equipment for flights in CMNPS airspace must meet the following conditions and certifications:

- Navigation equipment must be certified by the State of Registry or the State of the Operator as meeting the NAT HLA minimum requirements (previously referred to as MNPS) to operate within CMNPS airspace, unless the ATC unit concerned indicates that the non-certified aircraft can be accommodated without penalty to certified aircraft.

- Required long-range RNAV systems must be certified and shown capable of navigation performance within the following specifications:
  - The standard deviation of lateral track errors is less than 6.3 NM;
  - The proportion of total flight time spent by aircraft 30 NM or more off the cleared track is less than $5.3 \times 10^{-4}$ (i.e., less than 1 hr in about 2,000 flight hours); and
  - The proportion of total flight time spent by aircraft between 50 and 70 NM off the cleared track is less than $13 \times 10^{-5}$ (i.e., less than 1 hr in about 8,000 flight hours).
• Navigation performance capability must be verified by the State of Registry or the State of the Operator, as appropriate. Aircraft that operate within designated airways and company-approved routes, which are completely in signal coverage of ground-based navigation aids, satisfy CMNPS requirements when operating within the protected airspace for airways and company-approved routes.

• At a minimum, aircraft are required to use the following navigation systems in the CMNPS airspace, depending on the route operated:
  – Aircraft transiting CDA to or from another continent must be equipped with two long-range RNAV systems or one navigation system using the inputs from one or more sensor systems, plus one short-range navigation system (ADF, VOR/DME).
  – Aircraft operating within North America on routes that lie within reception of ground-based navigation aids must be equipped with a single long-range RNAV system plus a short-range navigation system (ADF, VOR/DME).
  – Aircraft operating on high-level airways or company-approved routes must be equipped with dual short-range navigation systems (ADF, VOR/DME).

For a description of other types of regulated airspace and airspace classification, refer to the Designated Airspace Handbook (TP 1820E), this publication is available on the NAV CANADA website:

<www.navcanada.ca>
Aeronautical Information
Operational Guides
Canadian Airport Charts and Designated Airspace Handbook
Designated Airspace Handbook
Download current issue
ENR 3. ATS ROUTES

For ATS routes, distances are in nautical miles and tracks are magnetic, except in the Northern Domestic Airspace (NDA) where tracks are referenced to true north.

ENR 3.1 Conventional Navigation Routes

3.1.1 Route Designators

Refer to section GEN 3.4 “Communication Services” for more details on CPDLC, PBCS and the associated RCP 240 and RSP 180 performance requirements.

For a list of route designators, names, and geographical coordinates of all significant points including compulsory or on-request reporting points, refer to the CFS, Section C, “Planning.”

For a graphical portrayal of the routes and significant points, refer to the appropriate low level enroute charts (VNC, LO) and high level enroute charts (HI) (see Figure 3.1.1-1, “Index to Low Altitude Charts” and Figure 3.1.1-2, “Index to High Altitude Charts”).

These publications are available for purchase from NAV CANADA’s e-commerce store at:

<www.navcanada.ca>
Aeronautical Information
Online Store
Figure 3.1.1-1, Index to Low Altitude Charts
3.1.2 Tracks or VOR Radials

For information on tracks or very high frequency (VHF) omnidirectional range (VOR) radials, including changeover points, for conventional navigation routes, see the appropriate enroute low or high altitude charts.

3.1.3 Upper and Lower Limits of Routes and Airspace Classification

The airspace within CDA and that airspace over international waters and foreign territory in which Canada accepts responsibility for the provision of ATC services is for use by conventional navigation routes.

For information on the upper and lower limits of low altitude ATS routes and airspace classification, see the appropriate enroute low or high altitude charts.
3.1.4 Lateral Limits and Minimum Obstacle Clearance Altitudes (MOCAs)
For information on the lateral limits of low altitude conventional navigation routes and the minimum obstacle clearance altitudes (MOCAs), see the appropriate enroute low altitude charts.

3.1.5 Direction of Cruising Levels
For information on the direction of cruising levels for conventional navigation routes, see the appropriate enroute charts and refer to the following publications:

*Canada Flight Supplement* or *Canada Water Aerodrome Supplement*, Section C, “Planning – Characteristics of Airspace – Cruising Altitudes and Flight Levels Appropriate to Aircraft Track”

3.1.6 Navigation Accuracy for each Conventional Navigation Route Segment
To determine if a route has any specific navigation requirements, see the appropriate enroute charts and refer to the following publications:

*Canada Flight Supplement* or *Canada Water Aerodrome Supplement*, Section C, “Planning – Characteristics of Airspace – Cruising Altitudes and Flight Levels Appropriate to Aircraft Track”

3.1.7 Remarks
Nil

**ENR 3.2 Area Navigation Routes**

3.2.1 Route Designators
For a list of area navigation (RNAV) routes, refer to the *Canada Flight Supplement*, Section C, “Planning – Mandatory IFR Routes – Fixed RNAV Routes” and Section E, “Military Flight Data and Procedures.”

3.2.2 Waypoints Defining VOR/DME Area Navigation Routes
For station identification of the reference VOR/distance measuring equipment (DME) defining an RNAV route, refer to the following publications:

For bearing and distance from the reference VOR/DME, if the waypoint defining an RNAV route is not collocated with it, refer to the following publication:

For elevation of the transmitting antenna of the DME defining an RNAV route, refer to the following publications:

3.2.3 Magnetic Bearing, Geodesic Distance and Distance Between Defined End Points and Designated Significant Points

For geodesic distance between defined end points and distance between each successive designated significant point for RNAV routes, refer to the Canada Flight Supplement, Section C, “Planning – Mandatory IFR Routes – Fixed RNAV Routes”.

3.2.4 Upper and Lower Limits of Routes and Airspace Classification

For information on the upper and lower limits of RNAV routes and airspace classification, see the appropriate enroute low altitude chart, enroute high altitude or terminal area chart (see Figure 3.1.1-1, “Index to Low Altitude Charts,” and Figure 3.1.1-2, “Index to High Altitude Charts”).

3.2.5 Direction of Cruising Levels

For information on the direction of cruising levels for RNAV routes, see the appropriate enroute low altitude chart, enroute high altitude or terminal area chart.

3.2.6 Navigation Accuracy for PBN Route Segments

Canada has not assigned a navigation specification to any PBN routes. High-level fixed RNAV routes require an onboard system with performance capabilities that are only met by GNSS or distance measuring equipment/inertial reference unit (DME/DME/IRU) systems. DME/DME/IRU navigation may be limited in some parts of Canada owing to navigational facility coverage. In such cases, the high level fixed RNAV routes will be annotated with “GNSS only” on the appropriate enroute chart. All low level fixed RNAV routes require the use of GNSS.

3.2.7 Remarks

Nil

ENR 3.3 Other Routes

For information on other routes in Canada, refer to current editions of the following publications:

- Designated Airspace Handbook (TP 1820E), this publication is available on the NAV CANADA website:
  <www.navcanada.ca>
  Aeronautical Information
  Operational Guides
  Canadian Airport Charts and Designated Airspace Handbook
  Designated Airspace Handbook
  Download current issue

- Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot
- Canada Flight Supplement, Section C, “Planning”
- The appropriate enroute low altitude, enroute high altitude or terminal area chart (see Figure 3.1.1-1, “Index to Low Altitude Charts,” and Figure 3.1.1-2, “Index to High Altitude Charts”)

Publication Date: 02 DEC 21
ENR 3.4 Enroute Holding

3.4.1 Holding Identification and Holding Fix

For the holding identification and the holding fix for enroute holding patterns, see current editions of the following publications:

- The appropriate enroute low altitude, enroute high altitude or terminal area chart (see Figure 3.1.1-1, “Index to Low Altitude Charts,” and Figure 3.1.1-2, “Index to High Altitude Charts”)
- Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot

3.4.2 Inbound Track

For the inbound track for enroute holding patterns, see current editions of the following publications:

- The appropriate enroute low altitude, enroute high altitude or terminal area chart (see Figure 3.1.1-1, “Index to Low Altitude Charts,” and Figure 3.1.1-2, “Index to High Altitude Charts”)
- Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot

3.4.3 Direction of Procedure Turn

For the direction of the procedure turn for enroute holding patterns, see current editions of the following publications:

- The appropriate enroute low altitude, enroute high altitude or terminal area chart (see Figure 3.1.1-1, “Index to Low Altitude Charts,” and Figure 3.1.1-2, “Index to High Altitude Charts”)
- Canada Air Pilot, Volumes 1–7, or Restricted Canada Air Pilot

3.4.4 Maximum Indicated Airspeed

The size of the airspace that must be protected for a holding pattern is directly proportional to the speed of the aircraft. In order to limit the amount of airspace that must be protected, maximum holding speeds in knots indicated airspeed (KIAS) have been designated for specific altitude ranges. Unless otherwise noted on the chart or when a climb in the hold is specified, holding patterns must be entered and flown at or below the following airspeeds:

<table>
<thead>
<tr>
<th>Altitude (ASL)</th>
<th>Maximum Holding Airspeed (KIAS)</th>
</tr>
</thead>

<td>310 (subject to CAR 602.32)</td>
</tr>
</tbody>
</table>

Note 1: At Canadian Military airfields, the size of the protected airspace is for a maximum of 310 KIAS, unless otherwise noted.

Note 2: For Copter procedures, the maximum airspeed is 90 KIAS for all altitudes, unless otherwise noted.
When a climb in the hold (shuttle climb) procedure is specified on a chart, an additional protected area has been provided to allow for greater airspeeds in the climb for those aircraft requiring them. This extra protected area is for a maximum of 310 KIAS, unless a maximum holding airspeed is noted on the chart, in which case that maximum airspeed is applicable.

In areas where turbulence is known to exist, the protected airspace is based on a maximum of 280 KIAS and will be noted on the chart.

Pilots are to advise ATC immediately if airspeeds in excess of those specified become necessary for any reason, including turbulence, or if they are unable to accomplish any part of the holding procedure.

### 3.4.5 Minimum and Maximum Holding Level

For minimum and maximum holding levels for enroute holding patterns, see current editions of the following publications:

The appropriate enroute low altitude, enroute high altitude or terminal area chart

### 3.4.6 Time and Distance Outbound

The still air time for flying the outbound leg of a holding pattern should not exceed one minute if at or below 14,000 feet ASL, or one and a half minutes if above 14,000 feet ASL. However, the pilot should make due allowance in both heading and timing to compensate for the wind effect.

After the initial circuit of the holding pattern, timing should begin abeam the holding fix or on attaining the outbound heading, whichever occurs later. The pilot should increase or decrease outbound times, in recognition of winds, to effect one minute or one and a half minutes still air time (appropriate to altitude) inbound to the holding fix.

When the pilot receives ATC clearance specifying the time of departure from the holding fix, adjustments should be made to the flight pattern within the limits of the established holding pattern to leave the holding fix as near as possible to the time specified.

### 3.4.7 Controlling Unit and Operating Frequency

For indication of the controlling unit and its operating frequency for enroute holding patterns, see current editions of the following publications:

The appropriate enroute low altitude, enroute high altitude or terminal area chart
ENR 4. RADIO NAVIGATION AIDS/SYSTEMS

ENR 4.1 Radio Navigation Aids — Enroute

For a list of stations providing radio navigation services for enroute purposes in Canada, refer to the Canada Flight Supplement, Section D, “Radio Navigation and Communications.” This section includes information on the identification, frequency/channel, geographical coordinates and elevation of associated DME antennae.

In the Canada Flight Supplement and the Canada Water Aerodrome Supplement, Section B, “Aerodrome/Facility Directory,” the table for each aerodrome may have a subheading NAV (navigation) that contains information on radio navigation and landing aids associated with the instrument approach and the terminal area procedures at the aerodrome.

ENR 4.2 Special Navigation Systems

Nil

ENR 4.3 Global Navigation Satellite System (GNSS)

The Global Navigation Satellite System (GNSS) indicated in Table 4.3, “Global Navigation Satellite System,” may be used for enroute, terminal and approach operations in Canada. The systems in Table 4.3 also meet the requirements of ICAO Annex 10.

Table 4.3, Global Navigation Satellite System

</tr>
</tbody>
</table>

The acceptable GNSS equipment standards are identified in AIP Canada ENR 4.3.1 “GNSS Equipment Requirements”. The GNSS equipment installation on Canadian registered aircraft must be approved in accordance with the appropriate sections of the Canadian Aviation Regulations (CARs), Part V – Airworthiness, and installed for use in accordance with AC20-130A and/or AC20-138() as applicable.
Equipment and installations approved by other Aviation Authorities (AAs) to equivalent requirements are also deemed acceptable for operations within Canada.

The pilot-in-command (PIC) must also ensure that the available equipment can satisfy the requirements of CAR 605.18(j) — Power-driven Aircraft—IFR.

Aircraft using non-WAAS/SBAS based augmentation systems to support GPS installations (TSO-C129, TSO-C129a or TSO-C196 All Revisions (AR)) for navigation under IFR must be equipped with an alternate approved and operational means of navigation suitable for the proposed flight. Provided that RAIM is available, monitoring of the alternative navigation equipment is not required. Procedures must be established for use in the event that the loss of RAIM capability is predicted to occur. In situations where RAIM is predicted to be unavailable, the flight must rely on other approved navigation equipment, re-route to where RAIM is available, delay departure, or cancel the flight.

If TSO-C145/C146 equipment is used to satisfy the RNAV requirement, the pilot/operator need not perform the RAIM prediction if WAAS coverage is confirmed to be available along the entire route of flight. In areas where WAAS coverage is not available, operators using TSO-C145/C146 receivers are required to check GPS RAIM availability.

Subject to aircraft operating limitations specified in the Aircraft Flight Manual or Flight Manual Supplement, Aircraft equipped with TSO-C145 or TSO-C146 GNSS based Navigation Sensors may not need to carry a non-GNSS alternate means of navigation. However, certain operations may require dual installation as necessary to fulfill availability and/or continuity requirements.

In the event of loss of GNSS navigation performance accuracy or integrity which results in the inability to support the planned flight operation, the pilot-in-command must advise air traffic services as soon as practical, stating “unable RNAV [DUE TO (REASON, E.G. LOSS OF GNSS)].”

GNSS-based approaches are charted as “RNAV (GNSS) RWY XX”, denoting that GNSS navigation shall be used for approach guidance, and the prefix “RNAV” is used in radio communications. Approaches flown using GNSS must be retrieved from a current navigation database. The PIC is responsible for ensuring the on-board navigation data is current, appropriate for the region of intended operation and includes the appropriate navigation aids, waypoints, and relevant coded terminal airspace procedures for the departure, arrival, and alternate airfields.

Navigation databases must be current for the duration of the flight. If the AIRAC cycle is due to change during flight, operators and pilots must have established procedures to ensure the accuracy of the navigation data, including the suitability of navigation facilities, routes and procedures for safe flight operations.

For flight within Canadian minimum navigation performance specifications (CMNPS) airspace or required navigation performance capability (RNPC) airspace see AIP Part 2 Enroute section 2.2.1. GNSS equipment identified in ENR 4.3.1 “GNSS Equipment Requirements”, can serve as the long range navigation system when in CMNPS or RNPC airspace.

4.3.1 GNSS Equipment Requirements

The acceptable GNSS equipment Minimum Operational Performance Specifications (MOPS) as identified by the FAA Technical Standard Orders, are defined in Table 4.3.1 “GNSS Equipment Requirements”. These TSOs are published by the U.S. Federal Aviation Administration (FAA) and adopted by reference by Transport Canada. TSOs or equipment approvals issued by other Aviation Authorities based on the same or equivalent underlying MOPS are also acceptable. For ease of readability only the FAA TSO has been referenced in this document.

Note 1: The GNSS equipment installation on Canadian registered aircraft must be approved in accordance with the appropriate sections of the Canadian Aviation Regulations (CARs), Part V – Airworthiness, and installed for use in accordance with AC20-130A and/or AC20-138( ) as applicable. Equipment and installations approved by other Aviation Authorities (AAs) to equivalent requirements are also deemed acceptable for operations within Canada.

Note 2: TSO-C129(AR) and TSO-C196(AR) GNSS equipment are supplemental Navigation systems and use aircraft based augmentation; they have performance limitations that requires other positioning and navigation systems, appropriate to the operation, to be on-board the aircraft. Per AC20-138A, TSO-129(AR) defines different classes of equipment to support different equipment configurations. These classes are defined in paragraph (a)(2) of TSO-C129(AR). Additional guidance regarding the RNAV and RNP operations that TSO-C129(AR) and TSO-C196(AR) GNSS equipment may support is provided in AC20-138( ). Further guidance is provided in the ICAO PBN Manual Doc 9613.

Note 3: Acceptable when integrated with a multi-sensor flight management systems (FMS) (TSO-C115b or later) with barometric vertical navigation (BARO VNAV) capability, certified in accordance with FAA AC 20-129 or equivalent.

Note 4: WAAS receivers certified prior to TSO-C145b and TSO-C146b, even if they have LPV capability, do not contain LP capability unless the receiver has been upgraded. Receivers capable of flying LP procedures must contain a statement in the Aircraft Flight Manual (AFM), AFM Supplement, or Approved Supplemental Flight Manual stating that the receiver has LP capability, as well as the capability for the other WAAS and GNSS approach procedure types.
4.3.2 Use of GNSS in Lieu of Ground-Based Aids (GNSS Substitution)

GNSS may be used in lieu of DME during departure/enroute/terminal/approach operations; it may be used in lieu of conventional (VOR and NDB) for departure/enroute/terminal operations provided the following conditions are met:

- an integrity alert is not displayed;
- fixes that are part of a terminal instrument procedure are named, charted and retrieved from a current navigation database; and
- when ATS requests a position based on a distance from a DME facility for separation purposes, reported GNSS distance from the same DME facility may be used by stating the distance in miles and the DME facility name (e.g. “30 miles from Sumspot VOR,” vice “30 DME from Sumspot VOR”).

GNSS may not be used in lieu of ground-based aids for:

- VOR and NDB final approach segment LNAV guidance on VOR- or NDB- instrument approach procedures (see Table 4.3.2 for GNSS substitution examples); or
- LOC LNAV guidance (see Table 4.3.2 for GNSS substitution examples).

- The appropriate VFR navigation chart

5.5.1 Formation Flights

Formation flight is considered to be more than one aircraft that, by prior arrangement between each of the pilots involved within the formation, operate as a single aircraft with regard to navigation and ATC procedures. Separation between aircraft within the formation is the responsibility of the flight leader and the pilots of the other aircraft within the formation. This includes transition periods when aircraft within the formation are manoeuvring to attain separation from each other to effect individual control, and during join-up and breakaway.

IFR and VFR flight planning procedures for formation flights are essentially the same as for a single aircraft with the following exceptions:

- a single flight plan may be filed for all aircraft within the formation;
- the flight lead will file an arrival report and close the flight plan for the formation;
- the Canadian flight plan/itinerary form is to be completed as follows:
  - Item 7, AIRCRAFT IDENTIFICATION: indicate the formation call sign,
  - Item 9, NUMBER AND TYPE OF AIRCRAFT AND WAKE TURBULENCE CATEGORY: indicate the number of aircraft, followed by the type of aircraft designator or, in the case of formation flights comprising more than one type of aircraft, insert ZZZZ,
  - Item 10, the letter “W” is not to be used for formation flights, regardless of the reduced vertical separation minimum (RVSM) status of aircraft within the flight, and
  - Item 18, OTHER INFORMATION: if ZZZZ is included in Item 9, insert TYP/ followed by the number and type(s) of aircraft in the formation; and
- if the formation is to be non-standard, the formation leader should insert the words “non-standard” and should indicate the parameters to be used in the OTHER INFORMATION section of the Canadian flight plan/itinerary form.
ATC will clear a formation flight as if it is a single aircraft. Airspace will be protected based on the assumption that, unless otherwise indicated in the flight plan, the formation will conform to the standard formation flight criteria. It is the formation leader’s responsibility to indicate in the flight plan and to coordinate with ATC if the formation will not operate in accordance with the following standard formation flight criteria:

- the formation leader will operate at the assigned altitude, and the other formation aircraft will be within 100 feet vertically of the altitude of the formation leader;
- the formation will occupy a maximum frontal width of 1 NM; and
- the formation will occupy a maximum longitudinal length of 1 NM between the first and the last aircraft.

The formation leader is responsible for separation between aircraft within the formation and for ensuring that all the formation aircraft remain within these parameters unless otherwise coordinated with ATC. Although IFR formation flights are expected to take off and land in formation, unforeseen conditions may preclude the formation from completing an IFR approach and landing. If it becomes necessary for a formation to break into individual elements or single aircraft, the formation leader should advise the controlling agency of the destination as soon as possible to allow ATC sufficient time to provide separation for each element or aircraft. In such instances, the formation leader will retain responsibility for separation between elements or aircraft until ATC separation has been achieved.

All formation flights will be considered as non RVSM certified flights, regardless of the RVSM certification status of the individual aircraft within the formation.

5.5.2 Photographic Survey Flights

CAR 602.34 – *Cruising Altitudes and Cruising Flight Levels*, exempts aircraft operated for the purpose of aerial survey or mapping from the cruising altitude for direction of flight requirement if certain conditions are met.

Photographic survey flights are exempt from the requirement to be RVSM certified to operate in RVSM airspace to conduct aerial survey or mapping operations. This exemption is not applicable for that portion of flight transiting to/from the area of operation.

Pilots intending to conduct aerial survey or mapping operations should refer to CAR 602.34 and obtain the publication, *Pilot Procedures Photographic Survey Flights* from:

NAV CANADA
Customer Service
77 Metcalfe Street
Ottawa, ON K1P 5L6

Tel.: 800-876-4693
Fax: 877-663-6656
E-mail: service@navcanada.ca

This publication describes flight requirements for pilots and operators conducting survey operations in Canadian airspace. It is published so that the ATC system can better accommodate the special demands and the unique operational requirements of aircraft on photographic survey missions.

ENR 5.6 Bird Migration and Areas with Sensitive Fauna

5.6.1 Wildlife Hazards

Trends indicate that there is a growing risk of collisions between wildlife and aircraft. This risk is due largely to corresponding increases in the populations of some hazardous species—such as deer, geese and gulls—and the numbers of aircraft operations across Canada.
All aviation stakeholders have a role to play in reducing the risks of wildlife strikes. Pilots can take three simple steps to help improve safety:

- Increase awareness of wildlife and the hazards they pose to aviation.
- Learn what risk-reduction and communication measures are in place at frequented airports.
- Become familiar with the bird/wildlife strike report form, and be sure to file a report in the event of any wildlife encounter.

This section provides information to help pilots gain a better appreciation of:

- measures airports must take to identify and control wildlife hazards, and to communicate with pilots about these hazards;
- bird/wildlife-strike reporting procedures; and
- migratory bird activity.

5.6.2 Airport Wildlife Management

In force since 16 May 2006, a new CAR recognizes that lands on and around airports often provide food and shelter for wildlife species that can be hazardous to air travel. Division III of CAR 302—Airport Wildlife Planning and Management, requires most Canadian certified airports to minimize risks, primarily by identifying and countering potentially hazardous species. Airports that are subject to the regulation must develop, implement and maintain plans for the management of these species.

The process of identifying wildlife hazards and measuring the risks they pose is called risk analysis. Under CAR 302, an airport operator must conduct a risk analysis as one of the first steps in creating an airport wildlife management plan. Pilots should be aware that these analyses must include consultations with representative samples of airport users, such as flight schools, airlines and pilots.

5.6.3 Communication of Wildlife Hazards

Provisions of CAR 302 also require airport operators to put in place effective communication and alerting procedures to quickly notify pilots of wildlife hazards.

Pilots should monitor ATIS and air-ground communications for information concerning wildlife hazards, particularly during spring and autumn migration periods when bird activity is at its peak. In unusual circumstances, a NOTAM may be used to identify these hazards.

Pilots who encounter wildlife on an airport are asked to immediately notify ATS, and take appropriate steps to minimize the risk associated with their flight.

Pilots who frequent Canadian certified airports are encouraged to ask about measures in place to ensure effective communication and to counter wildlife hazards.

5.6.4 Bird/Wildlife-Strike Reporting Procedures

To comply with CAR 302, airport wildlife management plans must be based on current wildlife-strike data, which is compiled by, and made available through, Transport Canada. Airports must report all bird/wildlife strikes to Transport Canada and keep records of these events; however, bird/wildlife strike reports can be filed by anyone, including airline personnel, ground crews and pilots.
Strike reporting is one of the most valuable contributions members of the aviation community can make in an effort to reduce wildlife risks. The data is vital to national and international airport wildlife management efforts, and one of the most important tools in tracking wildlife trends and determining hazards at locations across Canada.

Pilots are asked to report any knowledge of bird/wildlife strikes, no matter how inconsequential the event may seem. Even information about a near miss can help authorities learn more about the presence of potentially hazardous species, and the nuances of encounters between aircraft and wildlife.

In cases of bird strikes, reports should include the species whenever possible. Species identification provides airport operators with important data that enables them to effectively focus risk mitigation efforts. If the species is unknown, but bird remains are available from the incident, pilots may consult with airport wildlife management personnel for help identifying the species. Airport personnel may also decide to submit the remains for DNA analysis if they are unable to identify them.

CAR 302 requires an airport operator to amend its wildlife management plan, and submit it to Transport Canada for review within 30 days of the amendment, if a turbine-powered aircraft:

- suffers damage as a result of a collision with wildlife other than a bird;
- collides with more than one bird; or
- ingests a bird through an engine.

This process of review and amendment helps ensure wildlife management plans are as current as possible, addressing continual fluctuations in the wildlife hazards at airports. The review-and-amendment process is also set in motion when a variation in the presence of wildlife hazards is observed in an airport’s flight pattern or movement area. Pilots can help mitigate risk by reporting to Transport Canada any significant changes in the numbers or behaviour of hazardous wildlife at airports that are visited regularly.

5.6.4.1 Bird/wildlife strike report form

Figure 5.6.4–d: Autumn Migration Routes – Cranes, Ducks and Canada Geese)
Figure 5.6.4–e: Autumn Migration Routes – Other Geese

Figure 5.6.4–f: Autumn Migration Routes – Swans
5.6.5 Fur and Poultry Farms

Experience has shown that aviation noise caused by rotary wing and fixed wing aircraft flying at low altitudes can cause serious economic losses to the farming industry. The classes of livestock particularly sensitive are poultry (including ostriches and emus), because of the crowding syndrome and stampeding behaviour they exhibit when irritated and frightened, and foxes who, when excited, will eat or abandon their young. Avoid overflying these farms below 2,000 feet AGL.

Fur farms display watch towers or 20-foot-high pylons painted chrome yellow and black, with a red flag flying from a low mast during the months of February, March, April and May, that should be avoided below 2,000 feet AGL.

Pilots are, therefore, warned that any locations so marked should be avoided and that during the months of February, March, April and May, special vigilance should be maintained.

5.6.6 Protection of Wildlife

All pilots should recognize the importance of wildlife conservation. They are urged to become familiar with the game laws in force in the various provinces and to co-operate with all game officers to see that violations of game laws do not occur.

Pilots should be aware that flying low over herds of wild animals such as reindeer, caribou, moose, or muskoxen may result in reducing the animal population. Accidents resulting in broken bones may increase. Exhausted and disorganized animals are more susceptible to attacks from wolves; feeding is interrupted; and normal herd movement and reproductive functions may be seriously disrupted.

Serious damage can also be done to migratory birds due to low flying aircraft. The migratory bird regulations prohibit the killing of game birds using an aircraft. Geese in particular have great fear of aircraft; and their movements may be seriously disorganized by such interference. These birds are a valuable asset to Canada, and as several species are nearing extinction, it is felt that every effort should be made to preserve them.

In the interest of conserving wildlife, pilots must not fly at an altitude of less than 2,000 feet AGL, unless otherwise indicated, when in the vicinity of herds of wild animals or above wildlife refuges/bird sanctuaries depicted on affected aeronautical charts.

The landing or takeoff of aircraft in areas designated as bird sanctuaries may require a permit. Additional information can be found on the Environment and Climate Change Canada website:
https://www.ec.gc.ca/.

The following is a list of addresses where provincial and territorial game officers may be contacted in Canada. To obtain information on the preservation of wildlife within the various provinces, please contact a game officer at one of the locations shown below. Information pertaining to migratory bird regulations may be obtained directly from the Director General, Canadian Wildlife Service, Environment Canada, Ottawa ON K1A 0H3.

5.6.7 National, Provincial and Municipal Parks, Reserves and Refuges

To preserve the natural environment of parks, reserves and refuges and to minimize the disturbance to the natural habitat, overflights should not be conducted below 2,000 feet AGL. To assist pilots in observing this, boundaries are depicted on the affected charts.

The landing or takeoff of aircraft in the national parks and national park reserves may take place at prescribed locations. Contact information for each location can be found on the Parks Canada website here: <http://www.pc.gc.ca>.

Additional details can be found in the National Parks Aircraft Access Regulations available here: <http://laws-lois.justice.gc.ca/eng/regulations/SOR-97-150/page-1.html>
ENR 6. ENROUTE CHARTS

For information about enroute charts, refer to Aeronautical Charts – Enroute Charts on NAV CANADA’s website:

<www.navcanada.ca>
Aeronautical Information

Enroute Charts High & Low Altitude (HI/LO)
ENR 7. NORTH ATLANTIC (NAT) OPERATIONS

ENR 7.1 Rules and Procedures

7.1.1 Regulations

*Canadian Aviation Regulations* (CAR) 602.38 requires pilots of Canadian aircraft, when flying over the high seas, to comply with the applicable rules of the air set out in ICAO Annex 2, and with the applicable regional supplementary procedures set out in ICAO Doc 7030.

7.1.2 NAT documentation

The following documents are applicable to operations in the NAT region:

(a) ICAO Annex 2—*Rules of the Air*;
(b) ICAO Annex 11—*Air Traffic Services*;
(c) ICAO Doc 4444—*Procedures for Air Navigation Services—Air Traffic Management*;
(d) ICAO Doc 7030—*Regional Supplementary Procedures*;
(e) ICAO NAT Doc 001—*NAT SPG Handbook*;
(f) ICAO NAT Doc 006—*Air Traffic Management Operational Contingency Plan—North Atlantic Region*;
(g) ICAO NAT Doc 007—*North Atlantic Operations and Airspace Manual*; and
(h) *Gander Data Link Oceanic Clearance Delivery (OCD) Crew Procedures*.

7.1.3 General Aviation Aircraft

*Canadian Aviation Regulations* (CAR) 602.39 specifies the following:

“No pilot-in-command of a single-engined aircraft, or of a multi-engined aircraft that would be unable to maintain flight in the event of the failure of any engine, shall commence a flight that will leave Canadian Domestic Airspace and enter airspace over the high seas unless:

(a) the pilot-in-command holds a pilot licence endorsed with an instrument rating;
(b) the aircraft is equipped with
   (i) the equipment referred to in section 605.18,
   (ii) a high frequency radio capable of transmitting and receiving on a minimum of two appropriate international air-ground general purpose frequencies, and
   (iii) hypothermia protection for each person on board; and
(c) the aircraft carries sufficient fuel to meet the requirements of section 602.88 and, in addition, carries contingency fuel equal to at least 10 per cent of the fuel required pursuant to section 602.88 to complete the flight to the aerodrome of destination.”
7.1.4 Flight Rules

Over the high seas, the lower limit of all North Atlantic (NAT) oceanic control areas (OCA) is FL 055; there is no upper limit. Throughout the NAT region, airspace at and above FL 055 is Class A controlled airspace, and below FL 055 is Class G uncontrolled airspace.

At or above FL 060, flights shall be conducted under instrument flight rules (IFR) even when aircraft are not operating in instrument meteorological conditions (IMC).

Air traffic control (ATC) clearances to climb or descend while maintaining one’s own separation and remaining in visual meteorological conditions (VMC) shall not be issued to aircraft.

7.1.5 Time Keeping Procedures

Prior to entry into the NAT HLA, the time reference system(s) to be used during the flight for calculation of waypoint ETAs and waypoint ATAs should be synchronized to UTC. Refer to section 7.2.2 for more information on the NAT HLA.

All ETAs and ATAs passed to ATC should be based on a time reference that has been synchronized to UTC or equivalent. Acceptable sources of UTC include the following:

(a) The United States National Institute of Standards and Technology (NIST) HF radio station near Fort Collins, Colorado, (call sign WWV), which operates 24 hours a day on 2 500, 5 000, 10 000, 15 000, and 20 000 kHz (AM/SSB) and announces UTC time at the top of each minute.

(b) Approved (TSO-C129) GPS equipment on board (corrected to UTC) that allows pilots to access UTC time 24 hours a day.

(c) The National Research Council of Canada HF radio station in Ottawa (call sign CHU), which is available 24 hours a day on 3 330, 7 850, and 14 670 kHz (SSB). In the final ten-second period of each minute, it makes a bilingual station identification and time announcement in UTC.

(d) The British Broadcasting Corporation (BBC), which transmits the Greenwich time signal once every hour on a number of domestic and worldwide frequencies.

(e) Any other source shown to the state of registry or state of the operator (as appropriate) to be an equivalent source of UTC.

7.1.6 Flight Planning Procedures

7.1.6.1 Routes

For eastbound and westbound traffic:

(a) south of 70°N, the planned tracks shall be defined by significant points formed by the intersection of half or whole degrees of latitude at each 10° of longitude (060°W, 050°W, 040°W). For flights operating north of 70°N, significant points are defined by the parallels of latitude expressed in degrees and minutes with longitudes at 20° intervals; the distance between significant points shall, as far as possible, not exceed one hour of flight time. Additional significant points should be established when required because of aircraft speed or the angle at which meridians are crossed. When the flight time between successive significant points is less than 30 minutes, one of the points may be omitted.

(b) oceanic traffic transitioning through the Gander oceanic transition area (GOTA) from FL 290 to FL 600 shall flight plan an oceanic entry point (OEP), a 050°W coordinate, and a 040°W coordinate.
(c) Oceanic entry points AVPUT, CLAVY, EMBOK, KETLA, LIBOR, MAXAR, NIFTY, PIDS, RADUN, SAVRY, TOXIT, URTAK, VESMI, AVUTI, BOKTO, CUDY, DORRY, and ENNSO are restricted to flights conducted from FL 290 and above.

(d) Oceanic entry points HOIST, IRLOK, JANJO, KODIK, LOMSI, MELDI, NEEKO, PELTU, RIKAL, SAXAN, TUDEP, UMESI, ALLRY, BUDAR, ELSIR, IBERG, JOOPY, MUSAK, NICSO, OMSAT, PORTI, RELIC, SUPRY, and RAFIN shall be flight planned by all aircraft entering or exiting Gander oceanic airspace, regardless of altitude.

For northbound and southbound traffic, the planned tracks shall be defined by significant points formed by the intersection of whole degrees of longitude with parallels of latitude spaced at 5° (65°N, 60°N, 55°N).

For aircraft planning to fly within the Organized Track System (OTS) from the oceanic entry point to the oceanic exit point as detailed in the daily NAT track message, the track shall be defined in Item 15 of the flight plan by the abbreviation “NAT” followed by the code letter assigned to the track. (Refer to section 7.3.2 for more detail on OTS.)

For eastbound NAT flights planning to operate on the OTS, the second and third route options should be indicated at the end of Item 18 of the flight plan. Those operators who do not have the capability to provide this information in Item 18 of the flight plan should send the information by a separate Aeronautical Fixed Telecommunication Network (AFTN) message to Gander ACC (CYQXZQZX).

Examples:

RMKS/ … O2.X370 O3. V350 (Option 2 is Track X at FL 370; option 3 is Track V at FL 350).

RMKS/ … O2.RS390 O3.Z370 (Option 2 is random track south at FL 390; option 3 is Track Z at FL 370).

Note: In the preceding examples, options 2 and 3 are indicated by the letter “O” and not by the number zero.

ATS requires flights entering or exiting the Gander Oceanic Control Area (OCA) to flight plan in accordance with the published NAT OTS or, if exiting by way of 58°N 050°W and south thereof, via the following OEPs (compulsory reporting points) and associated 050°W coordinates. (See Table 7.1.6.1, “OEPs and Associated Coordinates”.)

ATS requires flights entering or exiting the New York Oceanic Control Area (OCA) through Canadian Domestic Airspace (CDA) to flight plan over one of the following compulsory reporting points: NOVOK, JEBBY, BOBTU, or TALGO; or via ELERI or MUSPO, for flights arriving at or departing from Halifax airport (CYHZ). Eastbound flights that exit the New York OCA via CDA and subsequently enter the Gander OCA are required to flight plan in accordance with the published NAT OTS or over an oceanic entry point and a 050°W coordinate.

Flights exiting the New York OCA via BOBTU should contact Gander ACC five minutes prior to BOBTU on frequency 134.7 MHz. Operators should be aware that if the NAT OTS includes tracks that are at or south of SUPRY 46°N 050°W (or 46°N 050°W SUPRY), optimal flight levels and routes may not be available.

To facilitate effective coordination for flights entering or exiting the Gander domestic control area (CTA) and the New York OCA via 44°N 050°W or south thereof:

(a) eastbound flights exiting the Gander domestic CTA directly into the New York OCA are required to flight plan via LOMPI direct JAROM direct TALGO direct 44°N 050°W or south thereof;

(b) eastbound flights exiting the New York OCA directly into the Gander domestic CTA are required to flight plan via BOBTU;
   – When the eastbound OTS are anchored at RAFIN and/or TALGO, BOBTU will be unavailable for eastbound NAT traffic flight planning FL300 to FL400 inclusive

(c) westbound flights exiting the New York OCA directly into the Gander domestic CTA are required to flight plan via BOBTU direct JAROM direct LOMPI.

Note: TALGO is not to be used for westbound flights.

ATS system parameters require all westbound flights transiting from the Gander OCA or the GOTA to the Montréal FIR/CTA to flight plan via 060°W below FL 290 and via an oceanic entry point if operating from FL 290 up to and including FL 600, followed by both a boundary reporting point and then one of the following inland reporting points: LAKES, LOPVI, RODBO, JELCO, FEDDY, TEFFO, DUTUM, or BEZED. KENKI and IRBIM are not to be used as boundary reporting points. Flights operating from FL 290 and above may flight plan a Norther American Route (NAR) to or from an oceanic entry point.

7.1.6.2 Airspeed

The TAS or Mach number is to be entered in Item 15 of the flight plan.

7.1.6.3 Altitude

The planned cruising level(s) for the oceanic portion of the flight should be included in Item 15 of the flight plan.

Note: Pilots planning to conduct a flight wholly or partly outside the OTS should indicate in a flight plan a cruising level(s) appropriate to the direction of flight and in accordance with the flight levels as described in the NAT Flight Level Allocation Scheme (FLAS). (Refer to section 7.3.2.1 for more details on FLAS.)

Requests for a suitable alternative flight level may be indicated in Item 18 of the flight plan.
7.1.6.4 Estimated times

For NAT flights, the accumulated elapsed time only to the first oceanic FIR boundary (Gander accepts elapsed time to OEPs) is to be entered in Item 18 of the flight plan.

For flights conducted wholly or partly on the OTS, accumulated estimated times to significant points enroute are to be entered in Item 18 of the flight plan.

7.1.6.5 Aircraft Approval Status and Registration

For an aircraft certified as being in compliance with operations within NAT HLA, the approval status shall be indicated in Item 10a by entering the letter "X". It is the pilot’s responsibility to ensure that specific approval has been given for NAT HLA operations. (Refer to section 7.2.2.3 for more information on approval for the NAT HLA.)

For an aircraft certified as being in compliance with RVSM MASPS, RVSM approval shall be indicated in Item 10a by entering the letter "W". It is the pilot’s responsibility to ensure that specific approval has been given for RVSM operations. Refer to section 7.2.3.3 for more information on RVSM MASPS.

If the aircraft registration is not included in Item 7, it shall be indicated in Item 18.

7.1.6.6 Filing

NAT operators shall forward all flight plans for eastbound NAT flights to the Canadian ACCs whose FIR or CTA the flights will traverse. These flight plans shall include the EET for each CTA boundary in Item 18 of the flight plan. The AFTN addresses for Canadian ACCs are listed in Table 7.1.6.6.

Table 7.1.6.6, AFTN Addresses for Canadian ACCs

</tr>
</tbody>
</table>

Where possible, operators are to file eastbound NAT flight plans at least four hours prior to the ETA at the oceanic entry point specified in the flight plan.

7.1.7 Preferred Route Message (PRM)

North Atlantic (NAT) operators shall send preferred route messages (PRMs) for eastbound flights to the following Gander aeronautical fixed telecommunication network (AFTN) address:

(a) CZQXZQZX (Gander ACC)
(b) CZULZQZX (Montréal ACC)
The following format is to be used for eastbound PRMs:

[PRIORITY] [DEST ADDRESS] [DEST ADDRESS]
[DATE TIME OF ORIGIN] [ORIGIN ADDRESS]
[MESSAGE TYPE]-[COMPANY]-[EB]-[YYMMDD AT 030°W] –
[(DEP/ DEST) (INLAND FIX) (OEP) (OCA RPS) (LANDFALL) (LAST UK POINT) (NUMBER OF
FLT 01-99)]

Example:

FF CZQXZQZX  
130502 KJFKSWRW  
PRM-SWR-E-200113  
CYUL/LSZH JOOPY 49/50 49/40 49/30 49/20 BEDRA NASBA 02  
KJFK/LSZH PORTI 47/50 48/40 49/30 50/20 SOMAX ATSUR 03

Note 1: If there is no inland navigation fix (INF), the latitude crossing 080°W is to be
used.

Note 2: PRMs for eastbound flights are to be sent no later than 1000 UTC.

7.1.8 Clearances

7.1.8.1 Oceanic Clearances

Pilots intending to operate aircraft in the Gander OCA should note the following:

(a) Clearances for VFR climb, or descent will not be granted.

(b) The Mach number to be maintained will be specified.

(c) ATC will specify the full route details for aircraft cleared on a route other than an
organized track or flight planned route. The pilot is to read back the full details of the
clearance including the cleared track or details of the flight planned route.

(d) ATC will issue an abbreviated oceanic clearance to aircraft that will be operated along
one of the NAT organized tracks. The abbreviated clearance will include the track letter,
the flight level, and the Mach number or speed in knots to be maintained. The pilot is to
read back the clearance including the Track Message Identification (TMI) number. ATC
will confirm the accuracy of the readback and the TMI number.

Note: The OTS is identified by a TMI number (refer to section 7.3.2 for more
information on OTS), which is determined by using the Julian calendar for the
day on which the tracks are effective. The TMI number is contained in the
Remarks section on the NAT track message. Amendments to tracks that are
already published are indicated by appending a letter to the Julian date, (e.g.,
TMI 320A). A revised TMI will be issued for changes to:

(i) any track coordinate(s), including named points;

(ii) published track levels; or

(iii) named points within European routes west.

A TMI revision will not be issued for changes to other items such as NARs.
Whether received via data link or voice, the oceanic clearance to enter the Gander OCA has the following meaning:

(i) the clearance is valid only within oceanic airspace, and details the route, altitude, and speed at which the flight is to enter oceanic airspace;

(ii) the flight crew is not immediately authorized to change the route, altitude, or speed in order to comply with the oceanic clearance;

(iii) the flight crew is required to obtain a subsequent clearance in order to comply with the oceanic clearance; and

(iv) if unable to obtain a subsequent clearance, the flight crew should revert to the procedures for radio communications failure detailed in the CFS and in the NAT section of ICAO’s Regional Supplementary Procedures (Doc 7030) in order to manoeuvre as necessary to comply with the oceanic clearance.

7.1.8.2 Domestic Clearances – NAT Westbound Traffic

Pilots proceeding westbound across the NAT and entering CDA within the Gander, Moncton, and Montréal FIRs should comply with the following procedures:

(a) Flights whose oceanic clearance contains their flight planned oceanic exit point will not be issued enroute clearances upon entering the airspace and are to follow the flight planned route as cleared. Domestic enroute clearances will be issued:

(i) for flights that have been rerouted and exit oceanic airspace at a point other than the flight planned exit fix; or

(ii) at a pilot’s request for another routing; or

(iii) if a flight plan has not been received by the ACC.

(b) Flights that have been rerouted from the flight planned route and enter CDA within 120 NM of the flight planned oceanic exit point can anticipate a clearance to regain the flight planned route by the INF unless the pilot requests a different routing. For flights entering CDA more than 120 NM from the flight planned oceanic exit point, a clearance will be issued following consultation with the pilot.

(c) ATC will use the latest flight plan received before a flight departs. Subsequent changes to the flight plan route, including any changes received by the pilot from flight operations or dispatch, must be requested directly by the pilot on initial contact with the appropriate domestic ACC. Direct requests from flight operations or dispatch to ATC to re-clear aircraft will only be considered under exceptional circumstances and are not an acceptable alternative to a pilot-initiated request for a re-clearance.

(d) Domestic re-clearances by ATC may contain either the route specified in full detail or a NAR.

If an aircraft enters CDA via the Edmonton FIR, the onward domestic routing will have been established in coordination between the Reykjavik and Edmonton ACCs, and additional domestic clearance is not required. If there has been a change in route from the filed flight plan, clarification of the onward routing may be obtained from Edmonton ACC on request.
Westbound aircraft that have proceeded across the NAT and have entered the Gander Oceanic Transition Area (GOTA) or CDA shall maintain the last oceanic Mach setting assigned by ATC:

(a) unless approval is obtained from ATC to make a change; or

(b) until the pilot receives an initial descent clearance approaching destination.

**Note:** Pilots should request changes to their oceanic Mach setting once communication has been established within the GOTA or CDA.

### 7.1.8.3 Oceanic Clearance Delivery

Unless otherwise advised by ATC, the following oceanic clearance delivery procedures are in effect daily between 2330 and 0730 UTC (DST 2230 and 0630 UTC) for all eastbound oceanic flights that transit the Gander domestic FIR/CTA:

(a) Clearance delivery frequencies are published daily in the Remarks section on the eastbound NAT track message. During published clearance delivery hours, pilots are to contact Gander Clearance Delivery on the frequency designated for their oceanic entry point. Pilots should contact Clearance Delivery when they are within 200 NM of the specified clearance delivery frequency location. In the event that contact cannot be established, pilots are to advise ATC on the assigned control frequency. The following frequencies and frequency locations will normally be used:

<table>
<thead>
<tr>
<th>Frequency Locations</th>
<th>Frequencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natashquan (YNA) (50˚11'N 61˚47'W)</td>
<td>135.45 MHz</td>
</tr>
<tr>
<td>Allen’s Island (46˚50'N 55˚47'W)</td>
<td>128.45 MHz</td>
</tr>
<tr>
<td>Churchill Falls (UM) (53˚35'N 64˚14'W)</td>
<td>128.7 MHz</td>
</tr>
<tr>
<td>Stephenville (YJT) (48˚34'N 58˚40'W)</td>
<td>135.05 MHz</td>
</tr>
<tr>
<td>Sydney (YQY) (46˚09'N 60˚03'W)</td>
<td>119.42 MHz</td>
</tr>
<tr>
<td>Brevoort (63˚20'N 64˚08'W)</td>
<td>132.025 MHz</td>
</tr>
<tr>
<td>Kuujjuaq (YVP) (58˚05'N 68˚25'W)</td>
<td>134.2 MHz</td>
</tr>
</tbody>
</table>

(b) Operators who do not receive the NAT track message are to contact Gander Clearance Delivery when they are within 200 NM of the frequency location. In the event that contact cannot be established, pilots are to advise ATC on the assigned control frequency. Pilots are to maintain a continuous listening watch on the assigned control frequency while obtaining the oceanic clearance.

Flights that are equipped to request and receive solicited electronic oceanic clearances are not required to contact Clearance Delivery if an electronic clearance is received and confirmed successfully. Confirmation is the receipt of the following message: CLA RECEIVED CLEARANCE CONFIRMED END OF MESSAGE.

If the above message is not received, data link oceanic clearances must be verified, either with Gander Clearance Delivery, during published hours, or on the control frequency, outside of published hours.

ATC will not normally advise pilots to contact Gander Clearance Delivery. There is no requirement for pilots to confirm receipt of an oceanic clearance (including a data link oceanic clearance) from Gander Clearance Delivery with the assigned control frequency. Due to frequency congestion on both the clearance delivery and control frequencies, pilots should refrain from unnecessary lengthy discussions with respect to oceanic
clearances and procedures. Constructive comments and complaints should be processed post-flight through company operations.

Procedures and further information for flights intending to receive oceanic clearances via data link are published in *Gander Data Link Oceanic Clearance Delivery (OCD) Crew Procedures*.

### 7.1.9 Position Reports

Unless otherwise requested by ATC, flights shall make position reports at all points contained in their oceanic clearance.

Position reports shall include the reported position, including the time it is reached, the current flight level or passing flight level, and final level if either climbing or descending; the next reporting point and estimated time; and the succeeding reporting point per the cleared route. If the estimated time over the next reporting point is found to be in error by three minutes or more, a revised estimated time shall be transmitted as soon as possible to the appropriate ATC unit. Revisions to forward estimates are not required for flights with established ADS-C contracts.

When making position reports, all times shall be expressed in hours and minutes UTC.

If an aircraft in the Gander OCA is unable to communicate with Gander oceanic, the pilot shall endeavour to relay position reports through:

(a) another oceanic centre with which communication has been established;
(b) another aircraft in the NAT region (when out of range of VHF ground stations, aircraft may use 123.45 MHz for air-to-air communications, including the relaying of position reports); or
(c) another aircraft on emergency frequencies 121.5 or 243.0 MHz, if no other means is available.

### 7.1.10 Communications with ATC

All aircraft operating in the Gander OCA must be capable of conducting two-way radio communication with ATC. The radio communication equipment shall consist of at least one HF and one other long-range communication system (HF, CPDLC or SATVOICE). Carriage of HF radio and the additional long-range communication system is mandatory with the exception of operations on routes covered by VHF facilities. (refer to CFS Planning Section C for a list of VHF facilities)

See CARs 602.38 and 602.39 for Canadian registered aircraft or for aircraft entering the NAT via CDA.

For more details on equipage requirements in NAT HLA, refer to ICAO Annex 2 Flight Operating Rules and ICAO Doc 7030 Regional Procedures – North Atlantic Region, as well as national AIPs for the states concerned.

All flights operating in the Gander OCA should check-in on international air-ground frequencies.

### 7.1.11 Adherence to Mach Setting

While operating in Gander OCA and Canadian domestic airspace (CDA), aircraft shall adhere to the Mach setting assigned by air traffic control (ATC) unless approval is obtained from ATC to make a change, or until the pilot receives an initial descent clearance approaching destination. If it is essential to make an immediate temporary change in Mach setting (e.g., as a result of turbulence), ATC shall be notified as soon as possible that such a change has been made.
Pilots shall advise ATC at the time of the climb/descent request if it is not possible to maintain the last assigned Mach setting during enroute climbs and descents because of aircraft performance.

7.1.11.1 Operations Without Assigned Fixed Speed (OWAFS)

Until recently, a fixed Mach speed was required for every flight crossing the North Atlantic (NAT). With the removal of that requirement, NAT operations without an assigned fixed speed are possible. Flight Planning requirements and Oceanic Clearance procedures will not change.

The Mach speed desired for NAT crossings must still be filed. Should a fixed Mach speed be required, the requested speed will be used by air traffic control (ATC) when designing the oceanic clearance.

During operations without an assigned fixed speed, the last assigned speed (requested or filed) will be the basis for ICAO Annex 2, “Rules of the Air” flight crew procedures. ATC shall be informed if the speed varies by plus or minus Mach 0.02 or more from the last assigned speed.

There are no changes to the content or method of requesting or issuing oceanic clearances. Oceanic clearances will continue to be issued with a fixed Mach speed. Operators are expected to adhere to the assigned Mach speed contained within the issued oceanic clearance unless the message “RESUME NORMAL SPEED” is received either by voice or CPDLC.

The message “RESUME NORMAL SPEED” will be offered to all flights where operationally feasible. There is no need for flight crews to request variable speed or cost index operations. Flight crews may anticipate the message “RESUME NORMAL SPEED”, after entering the Gander OCA. Upon receipt of a RESUME NORMAL SPEED message flight crews are expected to select “ECON (Boeing) / Managed Speed (Airbus)” to fly a variable Mach.

ATC may assign a fixed speed at any time as required for traffic management.

7.1.12 Operation of Transponders

Transponders must be operated at all times on Mode A or Mode C on Code 2000, while operating in the North Atlantic (NAT) region. However, the last air traffic control (ATC) assigned code must be retained for a period of 30 min after entry into NAT airspace unless otherwise directed by ATC.

Note: This procedure does not affect the use of the special purpose codes 7500, 7600, and 7700.

7.1.13 Meteorological Reports

Aircraft must make, record, and report meteorological observations at each designated reporting point on a routine basis. However, aircraft cleared on an organized track should be required to make, record, and report meteorological observations only upon a specific request by air traffic control (ATC). The International Civil Aviation Organization (ICAO) air report (AIREP) form, as contained in Appendix 1 of the Procedures for Air Navigation Services—Air Traffic Management (Doc 4444), should be used for this purpose.

7.1.14 Altitude Reports

Aircraft cleared for climb or descent should report their level to the nearest 100 ft.

For all altitude changes, whether they are climbs or descents, pilots should report reaching the new level/cruising altitude to air traffic control (ATC).
7.1.15 Strategic Lateral Offset Procedures (SLOPs)

The strategic lateral offset procedure (SLOP) is now a standard operating procedure throughout the North Atlantic (NAT) region. This procedure mitigates collision risk and wake turbulence encounters. Pilots conducting oceanic flights within the NAT region with automatic offset programming capability are recommended to fly lateral offsets up to 2 NM right of centreline.

The introduction of very accurate aircraft navigation systems, along with sophisticated FMSs, has drastically reduced the number of risk-bearing lateral navigation (LNAV) errors reported in NAT airspace.

Paradoxically, the capability of aircraft to navigate to such a high level of accuracy has led to a situation where aircraft on the same track, but at different levels, are increasingly likely to be in lateral overlap. This results in an increased risk of collision if an aircraft departs from its cleared level for any reason.

SLOP reduces risk by distributing aircraft laterally. It is applicable within the New York Oceanic, Gander Oceanic, Shanwick Oceanic, Santa Maria Oceanic, Nuuk, and Reykjavik FIRs, and within the Bodø Oceanic FIR when flights are operated more than 185 km (100 NM) seaward from the shoreline. SLOP conforms to direction in the International Civil Aviation Organization’s (ICAO) Procedures for Air Navigation Services–Air Traffic Management (PANS-ATM) (Doc 4444) and is subject to the following guidelines:

(a) Aircraft without automatic offset programming capability must fly the route centreline.

(b) Operators capable of programming automatic offsets may fly the centreline or an offset up to a maximum of 2 NM right of centerline.

(c) Offsets to the left of centreline are not permitted.

(d) An aircraft overtaking another aircraft should offset within the confines of this procedure, if capable, so as to minimize the amount of wake turbulence for the aircraft being overtaken. The pilot should take into account wind and estimated wake vortex drift and time to descend. (Nominal descent rates for wakes are 300–600 feet/min.)

(e) Pilots should use whatever means are available (e.g., traffic alert and collision avoidance system [TCAS], communications, visual acquisition) to determine the best flight path to fly. Pilots may contact other aircraft on frequency 123.45 MHz, as necessary, to coordinate the best wake turbulence offset option.

(f) Pilots may apply an offset outbound after the oceanic entry point and must return to the centreline before the oceanic exit point. Position reports transmitted via voice should be based on the waypoints of the current ATC clearance and not the offset positions.

(g) There is no ATC clearance required for this procedure and it is not necessary that ATC be advised.

7.1.16 Gander Oceanic Flight Level Initiative (GO-FLI)

NAT operators have indicated that the ability to conduct mid-ocean step climbs enable more fuel-efficient flight profiles. Ongoing analysis supports the potential for fuel savings and reduced greenhouse gas emissions while suggesting operators may not be making full use of the flexibility of mid ocean requests for climb made available as a result of reduced separation standards supported by ADS-B surveillance services.

GO FLI represents a proactive controller approach for providing information to flight crews that could aid in flight deck decision making resulting in fuel savings and reductions in greenhouse gas emissions: crews transiting the Gander Oceanic Control Area (OCA) in NAT HLA will be advised if higher flight levels become available.
Gander’s Flight Data Processor (Gander Automated Air Traffic System (GAATS+)) routinely interrogates a flight’s vertical profile to determine if higher flight levels have become available. In addition, GAATS+ will parse out and retain level requests from flight plans, RCLs, CPDLC and voice requests. Should flight levels as identified from either of those venues become available GAATS+ creates a message for presentation to the responsible controller.

Flight crews will receive, by voice or CPLDC, “(FLIGHT IDENT) HIGHER FLIGHT LEVEL IS AVAILABLE IF REQUESTED, ADVISE INTENTIONS”.

If a climb would be beneficial to the flight, use CPDLC downlink message “REQUEST CLIMB TO [level]” or request higher with Gander Radio via HF voice. If a higher flight level is not requested, use CPDLC “ROGER” or advise Gander Radio via HF voice.

7.1.17 ARINC 424 Identifiers for Half-Degree Waypoints in the Gander Oceanic Control Area

Manual entry of latitude/longitude waypoints using short codes derived from the ARINC 424 paragraph 7.2.5 standard (5050N = 50°N/50°W, N5050 = 50°30’N/50°W) has been directly associated as a causal factor contributing to many of the occurrences of gross navigation errors within the NAT Region.

The use of the entire latitude/longitude coordinates to enter waypoints, using procedures that provide for adequate mitigation of display ambiguity, is strongly advocated to avoid FMC insertion errors.

If full latitude and longitude coordinates are not used to enter waypoints:

- Aircraft navigation data bases should NOT contain waypoints in the Gander Oceanic Control Area in the ARINC-424 paragraph 7.2.5 format of "Nxxxx".
- If an aircraft operator or flight planning service has an operational need to populate data bases with half-degree waypoints in the Gander Oceanic Control Area, they are advised to use an alternate format, such as "Hxxxx".

Flight crew procedures should require each pilot to independently display and verify the DEGREES and MINUTES loaded into the FMC for the latitude/longitude waypoints defining the route contained in the NAT oceanic clearance.

ENR 7.2 NAT Airspace

7.2.1 Gander Oceanic Transition Area (GOTA)

The implementation of additional surveillance and communication sites along the north-east coast of Canada allowed for the provision of enhanced services and led to the creation of the Gander oceanic transition area (GOTA).

The lower limit of the GOTA is FL 290; the upper limit is FL 600. The GOTA is Class A controlled airspace.

The GOTA consists of airspace FL 290 and above, from 6530N 060W, east to the Reykjavik area control centre (ACC) boundary, south to 6330N 055W, south along 055W to the Gander domestic boundary, north along the Gander/Montreal domestic boundaries, north to the Edmonton boundary, and then back to the point of origin (see Figure 7.2.1 for reference).

Surveillance services are provided by Gander ACC. The automatic dependence surveillance - contract/controller-pilot data link communications (ADS-C/CPDLC) log on address for aircraft in GOTA airspace is CDQX.
7.2.2 North Atlantic High Level Airspace (NAT HLA)

The NAT HLA is that volume of airspace between FL 285 and FL 420 within the OCAs of Bodo Oceanic, Gander Oceanic, New York Oceanic East, Reykjavik, Santa Maria, and Shanwick excluding the Brest Oceanic Transition Area (BOTA) and the Shannon Oceanic Transition Area (SOTA).

Operators of Canadian-registered aircraft intending to fly in the NAT HLA will be required to show that they meet all the applicable standards. Information on the measures necessary to gain approval may be obtained from the following:

(See GEN 1, "National Regulations and Requirements" for the appropriate regional office.)
Note: Prior to February 2016, NAT HLA was referred to as minimum navigation performance specifications (MNPS) airspace. As of January 2022, ICAO is removing all references to MNPS in the documentation, starting with NAT Doc 007. The Canadian Aviation Regulations (CARs) still refer to MNPS airspace and MNPS requirements. Therefore, the replacement of MNPS with NAT HLA is a transition in progress, which means both terms can be considered interchangeable until the removal is complete. Furthermore, Filing X in Field 10a of the flight plan is still required to indicate authorization to operate in the NAT HLA (refer to section 7.2.2.3 for more information).

7.2.2.1 Equipment Installation Approval

Transport Canada Civil Aviation Regional Airworthiness Engineer

Commercial Flight Standards:

Transport Canada Civil Aviation 330 Sparks Street
Ottawa ON K1A 0N8

Tel.: 1-800-305-2059
Fax: 613-990-6215

Figure 7.2.2.1, NAT HLA Between FL 285 and FL 420 see map
7.2.2.2 Monitoring Gross Navigation Errors

To ensure that the required navigation standards are being observed within the NAT HLA, continuous monitoring of the navigation accuracy of aircraft in this airspace takes place using surveillance systems in Canada, Ireland, France, Iceland, and the United Kingdom. In cases of a gross navigation error, the pilot will normally be notified by the ATC unit observing the error. The subsequent investigation to determine the error will involve the ATC unit, the operator, and the State of Registry.

If there is a serious increase in the number of large errors, it may become necessary to increase separation standards until remedial action has been determined. Alternatively, if rapid corrective action cannot be achieved, it may be necessary for the State of Registry or the State of the Operator to temporarily exclude offending aircraft types or operators from the NAT HLA.

7.2.2.3 Minimum requirements for operations within the NAT HLA

All operators are to ensure that aircraft used to conduct flights within the North Atlantic High Level Airspace (NAT HLA) have the minimum equipment requirements:

NAT HLA entry requires the following:

- RVSM approval (refer to section ENR 7.2.3.3)
- CPDLC (refer to section GEN 3.4.4.2)
- ADS-C (refer to section GEN 3.4.4.2)
- HLA approval by the State of the Operator (formerly referred to MNPS)
- RNAV 10 and / or RNP 4 navigation specification approval

For more detailed requirements, refer to the following documents:

(a) International Civil Aviation Organization (ICAO) Doc 7030—Regional Supplementary Procedures North Atlantic Regional Supplementary Procedures;
(b) ICAO NAT Doc 001—NAT SPG Handbook;
(c) ICAO NAT Doc 007—North Atlantic Operations and Airspace Manual;
(d) ICAO Doc 4444 (PANS-ATM) Appendix 2 Flight Plan; and
(e) Parts VI and VII of the Canadian Aviation Regulations (CARs).

When filing a flight plan for operations in the NAT HLA, operators must provide the following information:

- Equipment and capability (Field 10):
  - J5 or J7 (CPDLC over SATCOM)
  - D1 (ADS-C)
  - W (RVSM approved)
  - X (MNPS (or NAT HLA) approved)
  - R (PBN approved)
- Other information (Field 18):
  - PBN/ followed by navigation specification (A1 for RNAV 10 and L1 for RNP 4)
Example:

Field 10
SADE3GHIJ1J4J5M1P2RWXYZ/LB1D1

Field 18
PBN/A1B1C1D1L1O1S2T1

Eastbound aircraft requesting an oceanic clearance from Gander area control centre (ACC) to enter the NAT HLA may be asked by air traffic control (ATC) to confirm that they are NAT HLA (or MNPS) approved. Pilots/operators unable to provide such confirmation will be issued an oceanic clearance to operate their aircraft outside the NAT HLA (below FL 285 or above FL 420).

7.2.2.4 Aircraft without NAT HLA (or MNPS) Approval

An aircraft that does not meet the NAT HLA requirements may be allowed to operate in the NAT HLA if the following conditions are satisfied:

(a) The aircraft is being provided with ATS surveillance services;
(b) Direct controller-pilot VHF communication is maintained; and
(c) The aircraft has a certified installation of equipment providing it with the ability to navigate along the cleared track.

Note: Pilots operating aircraft in the NAT HLA under these provisions should familiarize themselves with NAT HLA operations and procedures. They should also have a current copy of the OTS message that is in effect for the time of their flight for situational awareness.

Aircraft that are not approved to operate in the NAT HLA and do not meet the above provisions may be cleared to climb or descend through the NAT HLA, traffic permitting.

7.2.3 Reduced Vertical Separation Minimum (RVSM)

7.2.3.1 Geographic boundaries

In the NAT, RVSM airspace is airspace within the geographic extent of the NAT region from FL 290 to FL 410 inclusive.

7.2.3.2 Details and Procedures

For RVSM details and procedures applicable to both the NAT and CDA, see Section RAC 11.7, “Reduced Vertical Separation Minimum (RVSM)”, available on the Transport Canada website at:

7.2.3.3 Minimum Aircraft System Performance Specifications (MASPS)

All operators of aircraft used to conduct flights within the North Atlantic high-level airspace (NAT HLA) where reduced vertical separation minimum (RVSM) is applied are to ensure that they meet the minimum aircraft system performance specifications (MASPS). For detailed requirements, refer to the following publications:

(a) International Civil Aviation Organization (ICAO) Doc 7030—Regional Supplementary Procedures;
(b) ICAO NAT Doc 001—NAT SPG Handbook;
(c) ICAO NAT Doc 007—North Atlantic Operations and Airspace Manual; and
(d) Parts VI and VII of the Canadian Aviation Regulations (CARs).
Eastbound aircraft requesting an oceanic clearance from Gander area control centre (ACC) to enter the NAT HLA at designated RVSM altitudes may be asked by air traffic control (ATC) to confirm that they are approved for RVSM operations. Pilots/operators unable to provide such confirmation will be issued an oceanic clearance to operate their aircraft outside RVSM designated altitudes.

7.2.3.4 Aircraft Approvals

Operators of Canadian-registered aircraft intending to fly in NAT RVSM airspace will be required to show that they meet all of the applicable standards. Further information on the measures necessary to gain approval may be obtained from the following:

**Airworthiness Approvals**

RVSM Maintenance Programs Director, Standards (AART)

Central Monitoring Agency (CMA)

The Regional Monitoring Agency for the NAT is the CMA located in Prestwick, UK, and it may be contacted at the following address:

North Atlantic Central Monitoring Agency c/o National Air Traffic Services
Room G41, Scottish & Oceanic Area Control Centre, Sherwood Road,
Prestwick, Ayrshire  KA9 2NR United Kingdom

Tel.: +44 1292 692412
Strumble HMU status
(recorded message) +44 1292 692760
Fax : +44 1292 692754
E-mail: natcma@nats.co.uk

Information on the responsibilities of the CMA and the procedures applicable to it are contained in ICAO NAT Doc 001—NAT SPG Handbook, available at the following address:

<www.icao.int/EURNAT/Pages/EUR-and-NAT-Document.aspx>

7.2.4 Data Link Mandate (DLM) Airspace

7.2.4.1 General Information

The objectives of the NAT Data Link Mandate are to enhance communication, surveillance, and air traffic control (ATC) intervention capabilities in the NAT region. ADS-C provides conformance monitoring of aircraft adherence to cleared route and flight level significantly enhancing safety. ADS-C also facilitates search and rescue operations including the capability to locate the site of an accident in oceanic airspace. CPDLC substantially improves air/ground communications capability and therefore controller intervention capability.

7.2.4.2 DLM Flight levels

DLM airspace encompasses FL290 to FL410 inclusive throughout the NAT region.

7.2.4.3 Flights Permitted to Operate within NAT DLM airspace

The following flights may flight plan to operate in NAT DLM airspace:

1. Flights equipped with and prepared to operate FANS 1/A (or equivalent) CPDLC and ADS-C data link systems (see ICAO Doc 7030 3.3.2 and 5.4.2).
   (a) The appropriate equipage to be indicated in Item 10 of the ICAO flight plan is:
       ▪ D1; and
       ▪ One of J2, J5 or J7

2. Non-equipped flights that file STS/FFR, HOSP, HUM, MEDEVAC, SAR or STATE in item 18 of the flight plan.

Note: Such flights may not receive an ATC clearance that matches flight planned requests depending on tactical situations.
7.2.4.4 Operational Policies

Non-equipped aircraft may request to climb or descend through NAT DLM airspace. Such requests will be considered on a tactical basis.

Altitude reservation requests will be considered on a case-by-case basis irrespective of the equipage status of the requesting aircraft.

7.2.4.5 Equipment Failure of either ADS-C or CPDLC systems

- Prior to departure
  - Resubmit flight plan to remain clear of NAT DLM airspace
- After Departure but prior to entering DLM airspace:
  - ATC must be notified prior to entering DLM airspace.
  - Requests to operate in DLM airspace will be considered on a tactical basis.
- After entering NAT DLM airspace:
  - ATC must be notified immediately.
  - Tactical consideration will be given to allow the flight to continue in NAT DLM airspace. Flights may be required to exit NAT DLM airspace if traffic warrants.

7.2.5 Advanced Surveillance Enhanced Procedural Separation Standards (ASEPS) in the Gander Oceanic Control Area

ADS-B service has expanded into oceanic and remote areas facilitated by a constellation of Low Earth Orbit (LEO) satellites hosting ADS-B receivers. A satellite receives ADS-B data including position, velocity and altitude from aircraft, which is then routed through other satellites and down-linked to a satellite operations ground station. The expanded surveillance system will permit uninterrupted ATS surveillance for equipped aircraft before, during and after entry into the North Atlantic (NAT) Region.

As a result of the expanded surveillance coverage, reduced separation standards are available for eligible aircraft. In order to be eligible for the reduced standards, aircraft must meet the following requirements:

- RVSM/HLA approval
- ADS-B equipped, with dedicated 1,090 MHz out capability
- Specifications for RNP 4
- Specifications of RCP 240 and RSP 180

ATS systems use Field 10 (Equipment) of the standard ICAO flight plan to identify an aircraft’s data link and navigation capabilities. To be eligible for the reduced separations, operators should insert the following items into the ICAO flight plan (as per the 2012 flight plan format) for FANS 1/A or equivalent aircraft:

- Field 10a (Radio communication, navigation and approach aid equipment and capabilities);
  - insert “J5” to indicate CPDLC FANS1/A SATCOM (Inmarsat) or “J7” to indicate CPDLC FANS1/A SATCOM (Iridium) data link equipment; and
  - insert “P2” to indicate RCP 240 approval.
• Field 10b (Surveillance equipment and capabilities);
  – insert “D1” to indicate ADS with FANS1/A capabilities; and
  – B1 or B2 to indicate ADS-B.
• Field 18 (Other Information); insert the characters “PBN/” followed by “L1” for RNP4 and
  SUR/RSP180

Prior to entering the NAT Region, flights are generally provided air traffic control service using ATS
surveillance, combined with VHF Direct Controller-Pilot Communications (DCPC). These flights are, in most
cases, advised [SURVEILLANCE SERVICE TERMINATED] upon transfer to the appropriate oceanic control
centre. This phraseology was retained because pilots often use it as a reminder to adopt NAT Region flight
crew procedures.

Regardless of whether ATC issues a message that ATS surveillance is terminated, existing flight crew
procedures continue to be required and remain unchanged while operating in the NAT region oceanic
airspace.

Furthermore, with the expansion of ATS surveillance services in the NAT Region, the transition of aircraft
(operating ADS-B and secondary surveillance radar [SSR] equipment) across adjoining areas of surveillance
systems coverage will not normally constitute an interruption in identification. The termination of ATS
surveillance service does not imply that the identification of the aircraft to the ATC system is terminated;
eligible flights suitably equipped with an operational ADS-B transmitter may consider themselves identified
while operating in Gander’s oceanic airspace and will attain ATS surveillance services specific to the NAT.

In addition to expanded surveillance coverage and reduced separations, Aireon ALERT Aircraft Locating
Emergency Response Tracking is now in operation. ALERT (Aircraft Locating and Emergency Response
Tracking) is a free global aircraft tracking solution that captures ADS-B data available to be shared with
appropriate registered SAR organizations, ANSPs, Aircraft Operators, and Regulators.

To register for Aireon ALERT, ANSPs, Aircraft Operators, Regulators and Search and Rescue refer to

Note:  Given that the ASEPS trials have ended and separation minima using
surveillance systems where VHF is not available are now applicable in the
PANS-ATM, Procedures for Air Navigation Services – Air Traffic Management
(ICAO Doc 4444, 16th edition, 2016), this section has been incorporated from the
NAT OPS Bulletins 2018_006 and 2019_002 which were deleted on 5 November
2020; and subsequently AIC 28/19 which will be cancelled upon this publication.
7.2.6 Airspace Within Which ATS is Delegated to Gander OCA

When operating within Gander’s Oceanic airspace or airspace delegated to Gander OCA as defined below, operators are to use CPDLC address CZQX.

7.2.6.1 Airspace Delegated by Edmonton ACC

That portion of the Edmonton FIR at and above FL 290 bounded by a line beginning at:

| 651900N | 630000W | to |
| 652300N | 623800W | to |
| 653000N | 600000W | to |
| 650000N | 600000W | to |
| 650000N | 630000W | to point of beginning. |

and

That portion of the Edmonton FIR bounded by a line beginning at:

| 650000N | 600000W | to |
| 653000N | 600000W | to |
| 654236N | 582356W | to |
| 650000N | 574500W | to point of beginning. |

7.2.6.2 Airspace Delegated by Montreal ACC

That portion of the Montreal FIR from FL 180 to FL 280 bounded by a line beginning at:

| 640000N | 630000W | to |
| 650000N | 630000W | to |
| 650000N | 600000W | to point of beginning. |
7.2.6.3 Airspace Delegated by New York ARTCC

The portion of the New York Oceanic FIR at and above FL 55 bounded by a line beginning at:

<table>
<thead>
<tr>
<th>450000N</th>
<th>500000W</th>
<th>to</th>
</tr>
</thead>
<tbody>
<tr>
<td>443000N</td>
<td>500000W</td>
<td>to</td>
</tr>
<tr>
<td>433500N</td>
<td>554500W</td>
<td>to</td>
</tr>
<tr>
<td>442648N</td>
<td>560306W</td>
<td>thence</td>
</tr>
</tbody>
</table>

northeast along the New York Oceanic FIR boundary to point of beginning.

and

The portion of the New York Oceanic FIR at and above FL 55 bounded by a line beginning at:

<table>
<thead>
<tr>
<th>450000N</th>
<th>500000W</th>
<th>to</th>
</tr>
</thead>
<tbody>
<tr>
<td>450000N</td>
<td>400000W</td>
<td>to</td>
</tr>
<tr>
<td>443000N</td>
<td>400000W</td>
<td>to</td>
</tr>
<tr>
<td>443000N</td>
<td>500000W</td>
<td>to point of beginning.</td>
</tr>
</tbody>
</table>

7.2.6.4 Airspace Delegated by Nuuk FIC

The portion of the Sondrestrom FIR above FL 195 bounded by a line beginning at:

<table>
<thead>
<tr>
<th>633000N</th>
<th>554000W</th>
<th>to</th>
</tr>
</thead>
<tbody>
<tr>
<td>633000N</td>
<td>390000W</td>
<td>thence</td>
</tr>
</tbody>
</table>

southwest along the Gander Oceanic/Nuuk FIR boundary to point of beginning.

ENR 7.3 NAT Routes

7.3.1 North American Routes (NARs)

The North American route (NAR) system interfaces with North Atlantic (NAT) oceanic, the oceanic transition area, and domestic airspace and is used by air traffic transiting the NAT. NARs consist of a series of pre-planned routes to and from established oceanic entry/exit points and major identified airports throughout Canada and the United States.

NARs and their associated procedures are published in the Planning section of the Canada Flight Supplement (CFS) and in the Federal Aviation Administration’s (FAA) Airport Facility/Directory—Northeast.

7.3.2 Organized Track System (OTS)

Organized tracks are formulated and published in a North Atlantic (NAT) track message via the automatic fixed telecommunications network (AFTN) and sent to all interested operators. The daytime structure is published by Shanwick area control centre (ACC) and the night-time structure is published by Gander ACC.

Flight levels are allocated for use within the OTS and, in most cases, details of domestic entry and exit routings associated with individual tracks are provided in the NAT track message.
To permit an orderly changeover between successive OTS, a period of several hours is interposed between
the termination of one system and the commencement of the next. During these periods, operators are
expected to file random routes or use the coordinates of a track in the system that is about to come into
effect.

Eastbound traffic crossing 030˚W at 1030 UTC or later and westbound traffic crossing 030˚W at 0000 UTC or
later should plan to avoid the OTS at the published levels.

**Westbound**

(a) The westbound OTS message is designed and published by Shanwick daily.

(b) The most northerly track of a day OTS is designated as NAT Track Alpha; the adjacent
track to the south, as NAT Track Bravo; and so on.

(c) The valid times are 1130 to 1900 UTC at 30°W.

(d) The flight level profiles normally published are FL 310 to FL 390 inclusive

(e) Tracks that landfall at or north of CUDDY FL 340 will not be published.

   (i) FL 340 is omitted from these tracks to allow profiles for aircraft originating in the
   Reykjavik OCA.

**Eastbound**

(a) The eastbound OTS message is designed and published by Gander daily.

(b) The most southerly track is designated as Track Zulu; the adjacent track to the north, as
Track Yankee; and so on.

(c) The valid times are 0100 to 0800 UTC at 30°W.

(d) The flight level profiles normally published are FL 310 to FL 400 inclusive.

   (i) FL 310 is available on New York tracks only.

(e) Eastbound traffic routing, south of both the night datum line and the main OTS, should
flight plan using FL 310, FL 340, FL 360, or FL 380.

(f) New York Tracks entering Shanwick OCA that cross, or route south of, the night datum
line may be any combination of FL 310, FL 340, FL 360, or FL 380, or as otherwise
agreed between Santa Maria and New York. Additional levels will be allocated to New
York Tracks if the core OTS is located in that area.

**Note:** For this procedure “New York Tracks” are any eastbound OTS Tracks that
originate in the New York area and enter Gander or Shanwick OCAs.

7.3.2.1 Flight Level Allocation Scheme (FLAS)

As with procedures in CDA, aircraft flight planning in oceanic airspace should normally plan for a flight level
appropriate to the direction of flight, particularly when they are operating outside of the OTS structure and
valid times.

In an effort to provide efficient and economic profiles, NAT ANSPs, through consultation, have designed the
FLAS.

The FLAS standardizes flight levels available for traffic routing on and outside of the OTS as well as during
transition times (times between valid OTS).

Aircraft operators are advised to flight plan using the flight levels specified in this document, relative to their
particular flight(s).
7.3.2.2 FLAS Procedures

FLAS procedures entail:

(a) the establishment of flight level profiles normally available during OTS valid times;
(b) the establishment of flight level profiles during OTS changeover periods;
(c) the establishment of a night datum line, with the area south of the line reserved principally for traffic originating in New York/Santa Maria; and
(d) the establishment of a north datum line, with the area on or north of the line reserved for late-running westbound traffic from Reykjavik to Gander.

7.3.2.3 OTS Changeover Periods

(a) Basic Principles:
   (i) The time period between the expiration of one OTS and the commencement of another set is known as the OTS changeover period.
   (ii) All times relate to 030°W.
   (iii) OTS changeover rules apply from 0801 to 1129 UTC and from 1901 to 0059 UTC.
   (iv) During these times, flight levels shall be applied in accordance with the direction of flight except as stated below.

(b) Guidelines
   (i) Westbound traffic crossing 030°W from 2230 to 0059 UTC:
      ▪ Remain clear of the incoming OTS; and
      ▪ Do not plan delegated ODLs (FL 340 and FL 380).
      After 2230 UTC, the published OTS flight levels and ODLs are released to Gander for the use of eastbound traffic.
   (ii) Eastbound traffic crossing 030°W from 1000 to 1129 UTC:
      ▪ Remain clear of the incoming OTS at FL 350; and
      ▪ Do not plan the delegated ODL (FL 330).
      After 1000 UTC, the OTS (at FL 330 and FL 350) and ODL (FL 330) are released to Shanwick for the use of westbound traffic.
   (iii) Eastbound traffic crossing 30°W from 1030 to 1129 UTC at FL 370 and FL 390:
      ▪ Remain clear of the incoming OTS.
      After 1030 UTC, the OTS (at FL 370 and FL 390) is released to Shanwick for the use of westbound traffic.
   (iv) At the end of westbound (daytime) OTS:
      ▪ Westbound aircraft crossing 030°W until 1900 UTC at the ODL (FL 330) or on the OTS shall have priority over eastbound aircraft.
      During the westbound OTS hours of validity, Gander delegates FL 330 to Shanwick for use by westbound traffic.
(v) At the end of eastbound (night-time) OTS:

- Eastbound aircraft crossing 030°W until 0800 UTC at the ODLs (FL 340 and FL 380) or on the OTS shall have priority over westbound aircraft.

The table below provides a summary:

**Table 7.3.2.2, OTS Changeover Periods**

### 7.3.2.4 Night Datum Line

During the eastbound OTS hours of validity, a static datum line, known as the night datum line, is established with the following coordinates:

45°N 030°W – 49°N 020°W – SOMAX – ATSUR

FL 340 and FL 380 are delegated to Gander for eastbound traffic on and to the north of the night datum line.

FL 340 will not be used for Gander eastbound traffic to the south of the night datum line.

FL 380 will not be used for Gander eastbound traffic to the south of either the night datum line or the eastbound OTS, whichever is further south.
Between 0300 and 0700 UTC, a static datum line, known as the north datum line, is established with the following coordinates:

**URTAK – 60°N 050°W – 62°N 040°W – 63°N 030°W**

On and to the north of the north datum line, FL 380 is delegated to Reykjavik for use by westbound traffic.

In the event of a high volume of north random flights or OTS tracks, the north datum line may be suspended to accommodate the anticipated eastbound traffic.
7.3.3 Special Routes for Aircraft Fitted with a Single Long-Range Navigation System

In order to be considered capable of operating along the routes listed below, aircraft must have state approval to operate in the NAT HLA, be equipped with normal short-range navigation equipment (VOR/DME, ADF), and have at least one fully operational set of one of the following navigation equipment:

(a) DOPPLER with computer;
(b) INS;
(c) GPS approved in accordance with the requirements specified in TSO C-129 (Class A1, A2, B1, B2, C1, or C2); or
(d) FMS or IRS.

The aforementioned routes are known as Blue Spruce routes and are as follows:

(a) ATSIX (60N 010W) – 6100N 01234W – ALDAN – KFV (HF required on this route)
(b) RATSU (61N 010W) – ALDAN – KFV (VHF coverage exists and, subject to prior coordination with Scottish Airways and Prestwick [Shanwick OAC], this route may be used by non-HF equipped aircraft)
(c) GOMUP (57N 010W) – 60N 015W – 61N 01630W – BREKI KFV (HF required on this route)
The following routes are additional routes within the NAT HLA between Iceland, Greenland and Canada:

(a) SF – 6700N 06000W (DARUB) – YXP
(b) RE – 6930N 02240W – CP

ENR 7.4 Contingency and Emergency Procedures

7.4.1 In-Flight Contingencies

All pilots transiting the North Atlantic (NAT) should be thoroughly familiar with the in-flight contingency procedures for situations of rapid descent, turnback, diversion, and reduction of navigation capability.

In-flight contingency procedures are published in the following documents:

(a) International Civil Aviation Organization (ICAO) Doc 4444—Procedures for Air Navigation Services—Air Traffic Management;
(b) ICAO Doc 7030—Regional Supplementary Procedures;
(c) ICAO NAT Doc 001—NAT SPG Handbook;
(d) ICAO NAT Doc 007—North Atlantic Operations and Airspace Manual; and
(e) NAT OPS Bulletins.

7.4.2 Contingency Procedures for Oceanic Traffic in the Event of an Evacuation of Gander ACC

1. AIRCRAFT PROCEDURES – Westbound

1.1 Aircraft not in receipt of an oceanic clearance

1.1.1 In the event that Gander ACC must be evacuated, only aircraft with received and acknowledged oceanic clearances will be permitted to transit the Gander OCA.

1.1.2 If unable to obtain or acknowledge an oceanic clearance, flights should plan to re-route around the Gander OCA or to land at an appropriate aerodrome. Request the appropriate re-clearance on the current frequency. Frequency congestion is likely.

1.2 Aircraft in receipt of an acknowledged oceanic clearance

1.2.1 Aircraft operating with a received and acknowledged oceanic clearance should proceed in accordance with the clearance. Flights should not request changes in altitude, speed or route except for reasons of flight safety.

1.2.2 Any flights involved in level changes should complete the manoeuvre as soon as possible in accordance with any restrictions provided with the clearance.
1. AIRCRAFT PROCEDURES – Westbound

1.3 Contact Procedures

1.3.1 On receipt of an emergency evacuation message, pilots are requested to broadcast to other flights on 121.5, 243.0 and 123.45. A listening watch on these frequencies and the current frequency should be maintained until the flight exits the Gander OCA and FIR.

1.3.2 All flights within the Gander OCA should transmit position reports on any available HF or VHF frequency to Shanwick Radio either directly or through another agency or flight.

1.3.3 Flights should establish communication with the next agency at the earliest opportunity stating current position, cleared flight level, next position and estimate, and subsequent position. This also applies to flights using automated position reports (ADS/FMC) because those reports may not have been received by the next agency.

1.3.4 Flights within the Gander OCA should initially establish contact with Shanwick Radio. Flights within the Gander FIR should contact Montreal Centre or Moncton Centre, depending on their oceanic exit point as described in 1.3.7 below. Flights about to exit the Gander OCA into the New York OCA, the Reykjavik Oceanic CTA, the Santa Maria OCA, or the Nuuk FIR should contact New York Radio, Iceland Radio, Santa Maria Radio or Nuuk Radio as appropriate.

1.3.5 If unable to establish radio contact, flights may use SATVOICE voice or satellite telephone to provide position reports.

<th>Short Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gander Shift Manager</td>
<td>001 709 651 5207</td>
<td>N/A</td>
</tr>
</tbody>
</table>

1.3.6 Flights may request their flight dispatch offices to forward position reports, if sending position reports to multiple ATS Units or if otherwise unable to forward position reports.
1. AIRCRAFT PROCEDURES – Westbound

1.3.7 Based on where they exit oceanic airspace, flights shall proceed in accordance with the following table, until communication is established with, and a re-clearance issued by the next agency.

Flights operating FL290 and above.

## 2. AIRCRAFT PROCEDURES – Eastbound

### 2.1 Aircraft not in receipt of an oceanic clearance

#### 2.1.1
In the event that Gander ACC must be evacuated, only aircraft with received and acknowledged oceanic clearances will be permitted to transit the Gander OCA.

#### 2.1.2
If unable to obtain or acknowledge an oceanic clearance, flights should plan to re-route around the Gander OCA or land at an appropriate aerodrome. Flights may be required to re-route around the Gander FIR as well. Flights should request the appropriate re-clearance from Montreal or Moncton Centre. Frequency congestion is likely.

### 2.2 Aircraft in receipt of an acknowledged oceanic clearance

#### 2.2.1
Aircraft operating with a received and acknowledged oceanic clearance should proceed in accordance with the clearance. Flights should not request changes in altitude, speed or route except for reasons of flight safety or to comply with the oceanic clearance.

2.2.5 Flights at or east of 50 west longitude should initially contact Shanwick Radio. Flights about to exit the Gander OCA should contact New York Radio, Santa Maria Radio, Iceland Radio or Nuuk Radio as appropriate. The following information should be provided.

(a) Call sign
(b) Current position
(c) Current flight level and cleared oceanic flight level (if different from the current level)
(d) Assigned Mach or speed
(e) Next waypoint and estimate
(f) Subsequent waypoint

2.2.6 The following communications procedures have been developed in accordance with the Traffic Information Broadcast by Aircraft (TIBA) procedures recommended by ICAO (Annex 11 – Air Traffic Services, Attachment C). These procedures should be applied, unless otherwise instructed by Moncton or Montreal Centre when completing an altitude change to comply with the oceanic clearance.

At least 3 minutes prior to the commencement of a climb or descent the flight should broadcast on the last assigned frequency, 121.5, 243.0 and 123.45 the following:

ALL STATIONS
(call sign)
(direction)
DIRECT FROM (landfall fix) TO (oceanic entry point)
LEAVING FLIGHT LEVEL (number) FOR FLIGHT LEVEL (number) AT (distance)(direction) FROM (oceanic entry point) AT (time)

When the level change begins, the flight should make the following broadcast:

ALL STATIONS
(call sign)
(direction)
DIRECT FROM (landfall fix) TO (oceanic entry point)
LEAVING FLIGHT LEVEL (number) NOW FOR FLIGHT LEVEL (number)
## 2. AIRCRAFT PROCEDURES – Eastbound

### 7.4.3 Communications Failure – North Atlantic (NAT) Traffic

The following procedures are intended to provide general guidance for North Atlantic (NAT) aircraft experiencing a communications failure. It is impossible to provide guidance for all possible situations associated with a communications failure.

#### 7.4.3.1 General

If the aircraft is so equipped, a pilot experiencing a two-way radio communications failure shall operate the transponder in Mode C and squawk Code 7600.

The pilot shall attempt to contact any ATC facility, inform controllers of the difficulty, and request that information be relayed to the intended ATC facility.

#### 7.4.3.2 Communication Failure Prior to Entering NAT Oceanic Airspace

If operating with a received and acknowledged oceanic clearance, the pilot should enter oceanic airspace at the cleared oceanic entry point, flight level, and speed, and proceed in accordance with the received and acknowledged oceanic clearance. Any flight level or speed changes required to comply with the oceanic clearance should be completed within the vicinity of the oceanic entry point. The cleared oceanic flight level is the flight level contained in the oceanic clearance.

If operating without a received and acknowledged oceanic clearance, the pilot should enter oceanic airspace at the first oceanic entry point, flight level, and speed contained in the filed flight plan, and proceed via the filed flight plan route to landfall. The first oceanic flight level and speed should be maintained to landfall.

#### 7.4.3.3 Communication Failure Prior to Exiting NAT Oceanic Airspace

If the oceanic clearance includes the flight planned oceanic exit point, the pilot should proceed in accordance with the last received and acknowledged oceanic clearance, including flight level and speed, to the last specified oceanic exit point. The pilot should continue on the flight plan route and, after passing the last specified oceanic exit point, conform to the relevant state procedures and regulations.

If cleared on a route that contains an oceanic exit point other than the one contained in the flight plan, the pilot should proceed in accordance with the last received and acknowledged oceanic clearance, including flight level and speed, to the last specified oceanic route point. After passing this point, the pilot should conform to the relevant state procedures and regulations, rejoining the filed flight plan route by proceeding, via published ATS routes where possible, to the next significant point west of the last oceanic route point contained in the filed flight plan.
7.4.3.4 Provisions for Partial Loss of Navigation Capability

If an aircraft suffers partial loss of navigation capability (in which only one long-range navigation system is serviceable) prior to entry into oceanic airspace, the following routes should be considered:

(a) ATSIX – 6100N 01234W – ALDAN KFV
(b) RATSU – ALDAN – KFV
(c) GOMUP – 6000N 01500W – 6100N01630W BREKI KFV
(d) KFV – SOPEN – DA – SF – YFB
(e) KFV – EPENI – 6300N 03000W – 6100N 04000W – OZN
(f) OZN – 5900N 05000W – AVUTI (FL 290-FL 600) – PRAWN – YDP;
(g) OZN – 5900N 05000W – CUDDY (FL 290-FL 600) – PORGY;
(h) OZN – 5800N 05000W – HOIST – YYR;
(i) SF – 6700N 06000W (DARUB) – YXP;
(j) RE – 6930N 02240W – CP

These routes are subject to the following conditions:

(a) sufficient navigation capability remains to meet the requirements for the NAT HLA and the requirements in ICAO Annex 6, Part I, Section 7.3 and ICAO Annex 6, Part II, Section 3.7.2 can be met by relying on the use of short-range NAVAIDs;
(b) a revised flight plan is filed with the appropriate ATS unit; and
(c) an ATC clearance is obtained.

Note 1: A revised oceanic clearance will be issued after coordination between all oceanic ACCs concerned.

Note 2: If the OTS extends to the northern part of the NAT region, the aircraft concerned may be required to accept a lower than optimum flight level in the revised oceanic clearance, especially during peak traffic periods.

Note 3: This guidance material does not relieve the pilot from the requirement to take the best possible course of action in light of the prevailing circumstances.

ENR 7.5 Air-Ground Communications

Gander international flight service station (IFSS) is the only Canadian aeronautical station that provides international aeronautical telecommunication services. The defined hours of service for Gander IFSS can be found in section GEN 3.4, “Communication Services”.

7.5.1 High Frequency (HF) Operations in the North Atlantic (NAT)

All North Atlantic (NAT) high frequencies (HF) are organized into groups, known as families. The families are identified as NAT family A, B, C, D, E and F. Initial contact with Gander international flight service station (IFSS) on HF radio should be made on families B, C, D or F. When an aircraft fails to establish contact with Gander IFSS on the designated frequency, it shall attempt to establish contact on another frequency appropriate to the route.
### Table 7.5.1, Families of NAT HF Frequencies Monitored by Gander IFSS

</tbody>
</table>

*Note:* The NAT Family A of frequencies is not routinely monitored by Gander IFSS; however, they are available for use in unusual circumstances, such as an adjacent ATS Unit evacuation or loss of communications.

For information about hours of service, refer to the *AIP Canada* section GEN 3.4, “Communication Services” under subsection GEN 3.4.3, “Types of Service – HF”. For further details regarding Gander Radio Station Information, refer to the International Civil Aviation Organization (ICAO) NAT Doc 003 – *High Frequency Management Guidance Material for the North Atlantic Region*, Appendix B-2.

In the event that the overloading of a family occurs or is anticipated, aircraft of one or more operators may be offloaded from that family to another appropriate family for the expected duration of the condition. The offloading may be requested by any station, but Shannon and Gander will be responsible for making a decision after coordination with all NAT stations concerned.

When making initial contact with Gander Radio:

1. Westbound flights:
   1. Proceeding into Gander domestic airspace:
      1. Identify flight and request SELCAL check. No additional information is required.
      - e.g., ABC123, Request SELCAL
PART 2 – ENROUTE (ENR) NAV CANADA

(b) Proceeding into airspace other than Gander domestic:
- Identify flight, advise next CTA and request SELCAL check.
  e.g., ABC123, New York next, Request SELCAL

2. Eastbound flights:
   (a) Proceeding into Shanwick’s OCA
   - Initial call on VHF: Identify flight and request HF.
     e.g., ABC123, Request HF
   - Subsequent call on HF: Request SELCAL check.
     e.g., ABC123 request SELCAL

   (b) Proceeding into airspace other than Shanwick OCA
   - Initial call on VHF: Identify flight, state next CTA and request HF.
     e.g., ABC123, Santa Maria next, Request HF
   - Subsequent call on HF: Request SELCAL check.
     e.g., ABC123 request SELCAL

7.5.2 High Frequency (HF) Operations—Anchorage Arctic

Aircraft operating in the Anchorage Arctic control area (CTA)/flight information region (FIR) beyond the line-of-sight range of remote control very high frequency (VHF) air-ground facilities operated from the Anchorage area control centre (ACC) shall maintain communications with Gander Radio and a listening or selective calling system (SELCAL) watch on North Atlantic Delta (NAT D) network high frequencies (HF) 2,971 kHz, 4,675 kHz, 8,891 kHz, and 11,279 kHz. Primary daytime frequency is 11,279 kHz with primary nighttime frequency 8,891 kHz. Additionally, and in view of reported marginal reception of Honolulu Pacific in-flight meteorological information (VOLMET) broadcast in and adjacent to Canadian airspace, Gander Radio can provide, on request, Anchorage and Fairbanks surface observations and aerodrome forecasts to flight crews.

7.5.3 Availability of Single Sideband (SSB)

All international high frequency (HF) equipment is operated on single sideband (SSB) J3E emission. In all cases, the upper sideband (USB) is employed.

7.5.4 Selective Calling System (SELCAL)

The selective calling system (SELCAL) is installed on all international frequencies at Gander Radio. SELCAL provides an automatic and selective method of calling any aircraft. Voice calling is replaced by the transmission of code tones to the aircraft over the international radiotelephone channels. A single selective call consists of a combination of four pre-selected audio tones requiring approximately two seconds of transmission time. The tones are generated in the ground station coder and are received by a decoder connected to the audio output of the airborne receiver. Receipt of the assigned tone code (SELCAL code) activates a light or chime signal in the cockpit of the aircraft.

It is the responsibility of the flight crew to ensure that Gander Radio is informed of the SELCAL code available based on the airborne equipment, if they intend to communicate with Gander Radio. This may be done in connection with the off-ground report or when they are transferring in flight from one network to another.

SELCAL standards and procedures are found in the International Civil Aviation Organization’s (ICAO) Annex 10, Volume II. The worldwide administration of SELCAL code assignments has been delegated to Aviation Spectrum Resources, Inc. SELCAL code application forms may be obtained at: <www.asri.aero/selcal>.
7.5.5 North Atlantic (NAT) and Anchorage Arctic Regions—Satellite Voice Communications (SATVOICE) Use

SATVOICE may be used to contact Gander Radio for non-routine flight safety calls or during periods of poor HF propagation. Gander Radio may be contacted on 1-709-651-5328 or using Inmarsat short code 431613.

Note: SELCAL is used on all air-ground frequencies.

General purpose VHF communications facilities have been provided by Canada, Denmark and Iceland in order to supplement HF radio coverage in the NAT region. General purpose VHF coverage is shown on the following charts. It should be noted that:

(a) charts depict approximate coverage areas only;
(b) coverage at lower altitudes will be less than depicted; and
(c) the minimum altitude for continuous VHF coverage across the NAT is considered to be 30 000 ft (see the following charts).
Figure 7.5.5-1, NAT VHF Coverage at 10,000 ft
Figure 7.5.5-2, NAT VHF Coverage at 20,000 ft
Several attempts to establish communication may be necessary upon entry into the fringe area of reception. Aircraft should maintain SELCAL watch on HF when in fringe areas of VHF coverage. Upon exiting, communication should be re-established on HF channels before flying beyond normal VHF coverage.

Because VHF coverage is limited, aircraft must be equipped with an approved and serviceable HF radio capable of two-way radio communication with ATS from any point along the route of flight.

**Note:** Because of VHF coverage, aircraft may proceed across the Atlantic without HF radio subject to the following restrictions:

a) below FL 195, routing YFB – SF– KFV; and

b) FL 250 or above, routing YYR – OZN (or NA) – KFV.

### 7.5.6 ARINC 424 Identifiers for Half-Degree Waypoints in the Gander Oceanic Control Area

Manual entry of latitude/longitude waypoints using short codes derived from the ARINC 424 paragraph 7.2.5 standard (5050N = 50°N/50°W, N5050 =50°30’N/50°W) has been directly associated as a causal factor contributing to many of the occurrences of gross navigation errors within the NAT Region.

The use of the entire latitude/longitude coordinates to enter waypoints, using procedures that provide for adequate mitigation of display ambiguity, is strongly advocated to avoid FMC insertion errors.
If full latitude and longitude coordinates are not used to enter waypoints:

- Aircraft navigation data bases should NOT contain waypoints in the Gander Oceanic Control Area in the ARINC-424 paragraph 7.2.5 format of "Nxxxx".
- If an aircraft operator or flight planning service has an operational need to populate data bases with half-degree waypoints in the Gander Oceanic Control Area, they are advised to use an alternate format, such as "Hxxxx".

Flight crew procedures should require each pilot to independently display and verify the DEGREES and MINUTES loaded into the FMC for the latitude/longitude waypoints defining the route contained in the NAT oceanic clearance.
